Message-ID: <199610031501.KAA15057@tapr.org>

TAPR Office to reduce to minimum operations Oct 3, 1996

The TAPR Office will shutdown to minimum operations starting October 8th and running at least until October 28th.

This means that Dorothy will not be working the office phones during this period. The office will continue to operate, but at a much reduced level. E-mail, US mail, Voice Mail, etc will still be received and recorded, but everything will be processed at a very much slower rate during this period.

GPS-20 units have begun to ship. As of this e-mail, approximately 40 units have shipped. We are awaiting additional pins for the connector (suppose to arrive Oct 11th) in order to complete the remainder of the units. These pins replace the ones that were incorrect in the shipment we received. Once the pins arrive, we will get the other units out as soon as possible.

The Motorola EVM56002 have been placed on order and are expected to arrive sometime after Oct 21st. They will then be shipped out as time permits under the operational schedule at the office. There are something like 60 of the 200 units still available in this purchase at the $85 + $10 s/h price. Check the TAPR Web page for full details www.tapr.org. First come basis on these units.

TAPR is sorry for any delays that the reduced operations schedule at the office might cause. If everything turns out positive, the office should be back operational towards the end of October.

Cheers - Greg Jones, WD5IVD
President, TAPR

Right off hand i can't tell you but i know there's a direction finding page on the web that covers his DF stuff. I think there's a link to it on my WA8INZ page just below the Agrelo link. If you still can't find it let me know and i will track it down!.

Subject: Magnavox MX4200, anyone want one?
Message-ID: <199610031557.LAA14558@unix.asb.com>

Hi Folks

I have an MX4200 for disposal. Includes simple RS422<->RS232 interface, full docs, 4200.exe control program etc. Works fine, ideal for standalone tracker (I use one in the car). Ideally needs an amplified antenna, but lock *usually* obtained on a passive antenna. I typically use the Garmin amplified antenna with my MX4200's but have also used a generic amplified antenna, the Paccom one *should* work as well. Operates upto 80,000 ft and 1000knots, no 99knot limit like the Garmins! Will also supply unlimited EMail help to get it going with APRS!

If interested let me know by DIRECT Email please NOT via the SIG!

73 de bob w2/g3zfj

w2g3zfj@unix.asb.com

PS For those who don't know what an MX4200 is, its a small plastic box (about 6" x 4"x1.5") with three leds on the front for status info. Has two RS422 ports, one for control and one for rtcm104 input (DGPS) also has a NMEA port as well. Outputs GGA, VTG and GLL sentences plus lots of other info on satellite status etc if needed. Fully programmable for output rate, sentences etc. The 4200.exe program enables you to easily change all this. Battery back up. 12-24v input. Type 'F' antenna input, 25pin D type for data. Once you've programmed it you only need to turn it on.

Subject: Re: DGPS and ANNAPOLIS WIDE!
Message-ID: <113152@tomcat.gsfc.nasa.gov>

Bob -- thanks for telling me that the Balto/Wash area now is again WIDE! I just stopped by W3IWI-13 and changed the UNPROTO route accordingly.

All -- Now that the W3IWI-13 DGPS beacon has better coverage bouncing thru whatever WIDEs it can hit, I am really anxious to get reports from folks in the MD/DC/VA/DE/PA/SNJ area on your ability to use the DGPS corrections I'm broadcasting. In case you missed the earlier postings, W3IWI-13 is sending DGPS beacons addressed to DGPS via WIDE with a beacon sent every 20 seconds. The data is generated in some professional equipment and the DGPS correction quality should be >>BETTER<< than those sent by the Coast Guard on ~300 kHz or by commercial firms like DCI on FM broadcast subcarriers. With these corrections poked into your GPS receiver, you should obtain 1-10 meter accuracy within about 50 miles of the beacon site (Greenbelt MD) and should see improvements out to the 100-200 mile range. The DGPS beacons should virtually eliminate effects of Selective Availability and GPS broadcast ephemeris errors, and will minimize errors due to signal propagation thru the ionosphere and troposphere.

To use them, you need to make sure there is some data path from your TNC's data output into your GPS rcvr's input. This can be a direct TNC->GPS connection, or Bob has hooks in APRS to handle it for you. You may need to enable DGPS data on your GPS receiver; for example, in the Garmin 38/40/45 you need to go to the INTERFACES menu item, and select either NMEA/RTCM or NONE/RTCM. For most receivers, your TNC needs to be set to 4800 baud async data rate to make things work.

So please, send me (or post here) news on how the DGPS corrections are working for you! So far, apparently only a couple of us are using the correction signals.

Message-ID: <v03007800ae79b3d7b74d@[165.1.27.20]>

The entire APRS/MacAPRS/WinAPRS documentation is now in a ZIP file

ftp://aprs.rutgers.edu/pub/hamradio/aprs/APRSdocs.zip

This file contains the entire Web browser documents for all of the APRS, MacAPRS and WinAPRS documentation. This file is 634K.

Download this file and unzip with the -D option (very important).

Open "index.htm" with your favorite web browser. You will now have ALL of the documentation for ALL versions easy to access.

Note, you do NOT have to be connected to the net to use a web browser to access local files

Mark

Subject: Non-standard APRS messages
Message-ID: <9610031644.ZM26711@cancun.rose.hp.com>

Hi all,

I'm new to the group, and also new to APRS. My main interest is in Unix systems, not PC's or Macs, so I'm looking at doing my own software for APRS.

In monitoring the local channel I've found some unusual things, and I'm wondering if I'm misreading the protocol (in PROTOCOL.TXT) or are these people really sending bad messages?

First example:
/3814.64N/12200.08W# (comment here)
According to the spec, immediately following the leading / there should be a DDHHMM/ field. The only message that begins with a location and skips the timestamp is a fixed station message, which should start with !.

Second example:
@031622/3636.10N/12150.17W-PHG343.5 (comment here)
The PHG field is supposed to be exactly 4 digits. What's the decimal point doing there?

Third example:
!3801.10N/12034.59W#PGH5760/ (comment here)
PGH doesn't mean anything. It should be PHG.

I guess I have a few questions - is anyone else looking at the protocol at this level, or is everyone just running the shareware apps? If these are being sent by the shareware apps, why do they have badly formatted data?

Any help would be apprecitated.

Thanks,

Chris Moore

Well Southern Ontario is to Canada what Southern California is to the United States: Band Crowded.

I think I can safely say that Canada west of Sault St. Marie would definately be using 145.790 which seems to be what most (I didn't say all) of the States are using. Unfortunately nothing here yet for APRS usage however for interest sake in this discussion, the local BBS is on 144.310.

Hi,

I probably should have mentioned this, but I've already been in contact
with Bob and he's aware of my efforts. If I can't find the answers I'm
looking for here I'll go back to him, but I hate to bother him.

As far as the 'why', there are two reasons. First is the fact that I
prefer the unix and X11 environment. Although I have a few PCs I don't
use them much - I find they generate RFI, are susceptible to RFI, and they
tend to crash a lot. :-) The second reason is for the joy of experimenting
with HAM radio. I've never been the type that could homebrew a rig, but
software I can do!
So, thanks for the friendly warning. I understand your concerns, but as
I said I've talked with Bob and he knows I'm working on this.

Thanks,

Chris Moore

Subject: Weather Stations Assistance.
Message-ID: <961003232219_201692989@emout05.mail.aol.com>

Some questions regarding weather stations and APRS.

1. We have access to a Davis Weather Wizard III that we would like to get on the air.
    a. Is this APRS capable?
    b. Do both DOS APRS and WinAPRS support this device currently?
    c. Can it be operated in a stand-alone mode without computer?
    d. With an associated computer, can all the data logging functions still operate along with APRS and do you have to buy Davis's very expensive data logging software?

2. Reference Peet Bros:

a. Which is the better value system (U-2000, U-2, or U-500) for remote weather sites.

I know this is a multitude of questions, but we are trying to get a number of weather sites up here in Jacksonville, FL. Thanks for your help.

Actually Jim this fellow is looking into using the Baycom Packet-Modem (notice I didn't say TNC) as a digipeater thereby allowing the TNC currently in use to be used for other purposes. I do agree with your statement that you do not need a computer and the APRS software to run a WIDE or WIDE/RELAY. But seeing that _old_ computers are next to free (or even free sometimes) and the Baycom software can run on just about anything, I should think that using a Baycom for a WIDE would work just fine.

Hi Ken, I hope the following answers your questions:

Davis Instruments units are quite capable of APRS interface in versions
in APRS versions after 7.0....but, you must have a registered version
with a WX registration number, and you must have the computer interface
cable from Davis Instruments.

Both DosAPRS and WinAPRS support Davis, but again, only the registered
versions of same.

The Davis unit cannot currently operate in a stand-alone function with
APRS...but it can be a remote unit connected via telephone modem to your
home station.

The Davis Software can still be used (but not simultaneously) to record
data from the wx station....because,

yes, you MUST by the software from Davis because it comes with the cable
which contains the chip that contains the memory that stores the data...

And on the last question, that of value, it really just depends upon
what you need at your station....The U-II is temp/winddir/windspeed,
the U-500 adds the humidity and dewpoint, and the U-2000 adds the all
important barometer...thus the increased cost of each unit.

Have a question: on the message page there is a reference to
temporary or permanent bulletins. What is the difference
and how would you use them. I do use the bulletin to post
emergency wx information, net information, and other
general information. Thanks.

APRSdos REPLY/COMMENT: Bulletins to BLN# and BLNx are transmitted on the same normal APRS decaying algorithm, meaning the time to transmit is doubled after every transmission. The diference is that BLN#'s just keep decaying, while BLNx decay down to once every 12 minutes and stay at that rate. If you are doing anything in real time which wont mean much 2 hours later, then use BLN#. Here is the result for the first half hour for both (9 packets total):

```
*8* 16 *  32  *  1min  *   2min   *    4min    *    8min    *   16min   *
```

There is a version of APRS called X-APRS that is in the works. We have proof of concept working (Maps are being displayed under X) and expect (hope) to have a complete X-Windows version ready to release by Datyon of next year.

Hi Linda;

The only difference, is in the transmission periodicity.

When you input anything, the APRS software transmits a packet, then 7 seconds later another packet, then 14 seconds later another packet, then 28 seconds later another packet... If you permit it, eventually it will get to the point where it is transmitting the packet once every 24 hours. Once it gets to this point, it stops changing the time between packets (I read this in the docs, several versions ago, but haven't tested it).

Some types of data packets don't do that. The time will stop changing when it hits a maximum of 20 minutes between packets. The storms I post are this way and so are the station position packets and the permanent bulletins. Of course, if you (E)rase the bulletin, it will stop being transmitted.

The choice of what type of bulletin to use, depends on whether the information will continue to be critical after the first 40 minutes. If it will, then you should use a permanent bulletin, so any station coming on the net will still see the bulletin within twenty minutes of starting their software up.

For short term information, such as "EPAN NET accepting APRS checkins", the temporary bulletin would be preferred, so if you forget to (E)rase it afterward, it will space itself out and minimize the interference with normal net operations. On the other hand, If I had a tropical cyclone, coming our way, about 48 hours out. I would use a permanent bulletin, to announce it, so people who didn't normally use a large scale map display, would still find out about it, soon after they came up on the net.

Regards,
Joe

Chris, you may not be aware but there is a port of WINAPRS to unix in progress already. I don't mention this to discourage you as I also prefer unix over dos/windows. APRS is just about the only application I run under that environment any more. As an aside, linux (my preference) halts the processor rather than running in a idle loop when not busy, greatly extending battery life on a laptop.

WinAPRS does not support Kiss mode, I dont beleive dosAPRS does either.
You will have to take it out of KISS mode, if it does not support non-kiss
mode, it wont work.

WinAPRS will run just fine on your machine running Win 3.11.

WRONG, the UN-REGISTERED version of WinAPRS supports the davis instrument
EXACTLY the same as the registered version, only thing is you have to rest
all of the options each time you run the program

Hello,

One of the early OSCAR satellites had a in-band transponder that used the
144.3 to 144.5 region as well as the 145.8 to 146 region. Very fun to
operate with the desense!

There is a tendency for people to hold on to whatever resources they have.
If the satellite community is not currently using the 144.3 to 144.5 band
and there are no plans for the future use of it, then I think we should
"let it go".

I have a Garmin45 in my car hooked to the car 12v.  Do you run it with or
without the batteries.
  But the problem I had today was that it stopped working.  By that I mean I
left it running while I went to lunch.  When I got back (about 1 1/2 hrs, GOOD
lunch) it was flashing 'poor gps coverage' and all the signal strength
indicators were gone.  I turned it off and back on and got 8 bars right away.  I
was in a parking lot away from any buildings and had a good view of the sky.
  I have thought this has happened before when I have been driving for a couple
of hours.  I thought i DID lose coverage.  Now I am not so sure.
   Do I have a bad 45?

Thanks for any info.
Richard  N7Rig

I am not clear on if you are running with or without Batterys.

In my experience, the lousy thing needs the Batterys IN and GOOD!
Even if you are running on external power.

Sam

Is that BBS still getting current updates ? I checked in not too long ago
and the current version of APRS was far from current. I quite often would
chose a LL BBS over a TAPR DL if I am short of time if we knew for sure that

they BBS would be updated regularly.

126. Pico Packet - questions...

From: Daniel Velez <dvelez@infi.net>
Date: Sat, 05 Oct 1996 09:32:27 -0400
To: aprssig@tapr.org
Message-ID: <3256636B.79B2@infi.net>
Rendered body type: text/plain

Pico experts! My PICO w/2nd serial port arrived Thursday and I'm having a little trouble:

1. As I opened the box, I heard a little clink-a-clink inside the Pico's enclosure. I opened it up and the ROM dropped out into my hand! This was an easy fix after a quick call to PacComm confirmed I would do no harm separating the two circuit boards. It left me with an uneasy feeling, though.

2. It appears deaf to incoming packets...no DCD light and no packets being passed to the PC. I'm going to do as the manual says and verify the cable...I may also try and wire a second cable to my HT to see if it's a radio-tnc cable problem. It's too bad they eliminated the loopback feature in the Pico - this would have been helpful. I was hoping to use this feature to check the modem receive bias adjustment after verifying the cable. I'm not too hopeful, though, because of #2 below.

3. It also does not see (and doesn't pass to the terminal with ELO) incoming $GPRMC stings from the Motorla Oncore. I get the "Waiting for GPS data" message at the rate specified by LOCATION (the ONCORE is set up for RMC every second).

4. When I do resolve these problems, I need a little clarification. To use with APRS on the primary serial port and the MOTOROLA on the second, does the TNC forward the GPS data as set by LOC or as asked for by APRS with the LGE $05?   I think I do the following:

```
    LGE $05         (Does this mean I use HSP vice SPM???????
    LOC E 0         (Or do I need to set it to 3 for 30 second reports?
                     I think this is for standalone mode)
    GPSTE $GPRMC     (Easy enough)
    ELO OFF          (I had turned it on to check the GPS data)
    GPS OFF          (ON for standalone with one serial port?)
```

 I assume APRS sets the LPATH AND the UNPROTO...

Any suggestions or comments appreciated! I'm going to work on it today before I mail it back on Monday...

Hi all,
    Below is a letter I sent to the Sprouls. Kinda wonder what the rest of
you might think.

Gentlmen,
    Would you consider including support for a serial data aquisition
device in Mac APRS and I suppose Win APRS (I'm a Mac user by preference).
The idea is to have a universal interface for analog signals from any type
of instrument instead of only certain commercial weather stations. This
would allow Hams to develop their own weather stations, seismometers,
radiation monitors etc. I proposed such a device and associated software
support in the sig and one of the guys pointed out the existence of data
aquisition boards/boxes with RS232 interface that are available from
various manufacturers. I suppose it would be a good idea to evaluate the
various available products and choose one that is suitable, economical and
stable in terms of future availability.
    This would open up one of the nicest features of APRS to an unlimited
range of uses. Many of us are experienced enough in analog electronics to
experiment with the necessary instruments, and what is developed could be
published on the sig and elsewhere for others to duplicate.

Regards John Lakeland kc6vlr

Dan Velez asked of the SIG:

>Pico experts! My PICO w/2nd serial port arrived Thursday and I'm having
>a little trouble:

<little snip>

I hope to get mine back from Paccomm via overnight on Tuesday, they have
had it back in their shop for a week and as of Friday it was "cooking"
according to Linda there. Had only used it for a week when it headed
South, with me still here.

My TNC's problems had to do with its inability to initialize properly.
However, in my search for info from others in this area using one, I found
that it might be important to NOT run it near the top of its voltage range,
i.e. 13.5 volts, because it MIGHT act erratic. I spoke with two hams who
are running it at 7.5 volts.

The manual notes that if it appears to be dead, use the backslash command.
And I trust that you meant #3 below.
>

The way that I understand it, and I was running it for a short time, before
it stopped working, with MacAPRS 2.6.0 is that you specify in the APRS
software which string LTEXT the TNC is looking for from the GPS be it GGA
or RMC. The TNC upon seeing that string will load it into the text buffer,
and according to the interval setting, dump that buffer's contents out to
be transmitted.

133. HF digis

From: Steve Dimse <sdimse@bridge.net>
Date: Sat, 5 Oct 96 14:43:14 -0400
To: <aprssig@tapr.org>
Message-ID: <199610051838.OAA01861@bridge.net>
Rendered body type: text/plain

Hello to all...

I'm back in Miami after a long and enjoyable trip. I will write up a bunch of observations on APRS as I get time, but there is one which I want to start with now, the subject of HF digis.

As I understand it, the original plan of Bob's (Bob...correct me if I'm wrong) was to have all HF stations respond to the alias of ECHO, just as all VHF stations should repond to RELAY. There seems to be quite a few stations lately using GATE, RELAY or WIDE as HF aliases. As people have done this, others are setting their paths to RELAY or WIDE to take advantage of these HF digis. Is there a reason for this that I missed?

For most of my trip, I ran a path of ECHO,GATE,WIDE. Normally this would have created a lot of QRM, but with the decline of the use of ECHO, it seemed to work reasonably well. Several times during the trip I tried to figure out who was hearing me direct so I could put specific calls in my HF path, but I was never able to get good responses. There are a couple of points I'd like to propose for discussion.

1. Should base stations be discouraged from using generic paths on HF? I think so...it is fine to use a single, specific call as a digi, but there is plenty of time when you are "driving" a desk to figure out where propagation is good, and set your path accordingly.

2. Should HF mobiles be allowed to use generic aliases? Again, I think so. I had enough to worry about without trying to change my HF path 3 or 4 times a day to follow propagation. Using ECHO did not seem to cause QRM that I heard...when it sounded like someone was echoing my signal, I was almost always able to decode it, and only rarely was there more than a single echo of my packet. (Anyone have different observations? However, if everyone had been set up as ECHO, the QRM would have been excessive, so:

3. Should there be an HF digi system analogous to the WIDE system of VHF? In my travels, I found a few stations with consistantly good signals around the country (e.g. W7LUS, N0AN, N2CZF, WB6LPG). I think a handful of carefully picked stations, with an alias of, say HFWIDE, might be a good way to digi mobile signals without excessive QRM.

4. Should everyone be using a single alias (i.e. ECHO) and drop the use of WIDE, GATE, and RELAY? I think so...am I missing something?

Finally, to anyone planning a cross country trip: if there is any way, take HF. Probably less than 5% of my trip included VHF coverage, I would have had a disappointing time if I was not on HF. The HF gate in Atlanta went down before I got to Seattle, but until that point the use of javAPRS and WA4DSY's server worked well, my YL and mother loved watching me travel. My mother wanted to know why I didn't write javAPRS when I was 16 and she really needed it!

APRSdos REPLY/COMMENT: Its all done already. Its called the APRS MIM module. It is a complete data aquisition on a chip which takes 5 chaannels of analog signals and 8 bits of digital data and sends periodic APRS telemetry packets at any rate from 1 second to 9 hours. It costs $89 plus $5 S&H. See TELEMTRY.TXT. By being a stand alone system, you dont havce to tie up a PC. a MAC or anything...

SNIP

I run mine at 10.5 v with no trouble ....I have never trusted the manual
that says it is good to 13.5...........I also back it off to take care of
any v spikes that might occur on/off of the power supply. I also used a
battery supply that I made up from AA cells and it starts at 10.5 v and runs
down to about 6.0 v over three days running and then things start to fall apart.

Bob this has been a problem with APRS and TheNet from the beginning. In fact you used to mention it
in the docs about digi's and using TheNet. The problem is coming from the Node's always sticking
TheNet:callsign as the first thing in a beacon. Since this is hardcoded into the firmware YOU had to
change aprs to look !LAT/LONG at any point in the string instead of as the first thing in the string.
Remember???? The turning to Gray of THENET NODES has ALWAYS been a problem. I asked for a fix for
this many years ago, and now we are rehashing the problem. Yes it would be easy for no one to use
TheNet. But, I for one like the remote control capabilities and multi aliases that X1J provides.
Yes, I could go out and BUY new Kantronics tnc's with some of these capabilities and would even be
able to beacon the node farther than one wide away. But Why go spend money on new tnc's when the
one's I have are TAPR clones and X1J is freeware?   The easiest to do is to tolerate the fade to
gray or for one station close the node to hook it and uplink the digi to the rest of the network.
Hooking and uplinking solves of the problems with X1J, first it gets seen farther that one wide hop
away and it stays green.

Both, depending on how long it has been since an HSP toggle was done.

> I think I do the following:
>
>   LGE $05   (Does this mean I use HSP vice SPM???????

Yes. you can check it by going to O C T terminal mode and entering CTL
E. You should see a posit on the terminal each time.

```
>    LOC E 0         (Or do I need to set it to 3 for 30 second
>reports?

I set mine to 40

This sets it to report every 40  time intervals (can't remember if the
intervals are 10 seconds each, I think they are).  It is used only the
TNC isn't seeing an GPS posit request (LGE) at least once during that
interval.  LOC is refreshed each time the APRS program requests the GPS
posit.

Good Luck

```
Hi Bob;

It appears the dead reckoning of 77b is way off.

Tracking tropical disturbance 10, with an inputed
position of 2448.00, 09424.00 and cse/spd of 100/006 at
060300z, the position 7 hours later was only dead
reckoned for 13 miles movement instead of 42.

Oops... Just checked again, to make sure it is still
messing up an hour after the 060900z update. Aprs did not
appear to be dead reckoning any movement at all. Checked
the data line and found the time has gone in as 060900Z.
Re-entered the data and it happened again. Tried
repeatedly for 15 minutes, even deleting the storm so I
could start out with a blank line and restarting the
software several times. Every time I entered the lower
case z for zulu time, APRS converted it to upper case.

I used the (M)ap, (P)lot, (R)ange function, to eyeball
the correct current storm position. Then re-entered the
data with the time as "now" and thirty minutes later, the
deadreckoning is looking fine.

regards,
Joe

>bars right away. I was in a parking lot away from any buildings and had
>a good view of the sky.

I don't know of anyone who hasn't had this problem at one time or another. Sometimes it is associated with a short loss of coverage and the Garmin being unable to get into its recovery loop. At other times, I don't really see any reason for the loss of coverage and it appears to just go stupid. Turning it off and on gets it going again. Sometimes simply paging through the menus from the signal bars > settings page > signal bars brings it right back. It is a strange "bug" in my opinion, but not one that happens enough to complain about. IOW, your unit is working normally. 73,

I having a great time watching people all across the country doing APRS, but ave one frustration. I'm running WINAPRS and my path is set to WIDE, GATE,WIDE to reachfrom Malibu to one of two gateways in San Diego. But I never get any acknowlegements back from my messages. Even if those DX stations are unmanned, should I at least get a ACK back?? What am I doing wrong? I tried to match the DX's path by using GATE, WIDE instead, but no luck.
Also, how can I tel which of the two San Diego gates is relaying a particular DX transmission?? And is that information even important to know?
Thanks in advance for any help you can give.

73s de Jon

Scott - I think that setting LOC to 3 will really cause a lot of saturation on a busy local net! Whenever APRS is not running, or the serial cable is unplugged, you'll be beaconing every 30 seconds. This is pretty often, especially on a WIDE, WIDE path!

LOC only comes into play when the TNC doesn't see a posit request from the HSP toggle in APRS every LOC duration. Then it turns into a tracker, beaconing every LOC interval, thru the LPATH route.

In our area, we try to encourage unattended trackers to beacon no more often than every 4 minutes or so, and even that is too often many times.

Ralph, you're right, but here in Norfolk there are only four of us and
we've yet to install a WIDE :)  I was using the number as an example.

BTW, boxed up the Pico to send it back...hopefully there will be a quick
turnaround so I can get back on the air.

Could one of the Pico users (or maybe Bob) clarify:
```

```
-Does the GPS forward posit data at the rate set by LOC or by APRS'
POSRATE or _both_?  Someone mentioned "both" but I wanted to be sure.
-Operation is in HSP mode, right?
-Does HSP force a transmission as well as get the current posit with the
LGET $05 (F8)?
-Is APRS issuing the LGET to get the data at the POSRATE rate?
-Does APRS set up the LPATH _and_ UNPROTO???

As you can see, I'm trying to figure out the sequence of events to
determine how and how often APRS gets posit data from the Pico.  Then
I'm trying to understand when APRS transmits (does it transmit old or
new data?).

Yes and no.  If ELOC is ON, then the Pico will dump the current LTEXT buffer
to the RS-232-1
port at the rate determined by the LOC command.  If ELOC is OFF, then the
Pico will send a packet with the LTEXT buffer using the path in LPATH.
However, if Aprs requests for the latest fix using the character defined in
the LGEtchar command, then the pico will dump the LTEXT buffer to the
RS-232-1 port and reset the LOC timer regardless of the ELOC command.  So,
if your Pico is set to send its own beacons every 5 minutes and Aprs
retrieves a Gps fix every 4
minutes, then only Aprs will send gps beacons every 4 minutes while Aprs is
on.  When Aprs is turned off, the Pico will send Gps beacons every 5
minutes.  You can set the position report rates to whatever you choose, but
the LOC command must be longer than the time between Aprs retrieving Gps
fixes in order for it to work as described.

>-Operation is in HSP mode, right?

I'm not sure, as I don't fully understand how HSP works.  Maybe your answer
is above.  If someone could point me where to look for info on HSP, I would
be grateful.

>-Does HSP force a transmission as well as get the current posit with the
>LGET $05 (F8)?

When the Pico receives the character in LGETchar, it will send the LTEXT
buffer to Aprs on the RS-232-1 port, but the Pico won't send a packet by itself.

>-Is APRS issuing the LGET to get the data at the POSRATE rate?

I don't use DosAprs, so I'm not totally sure, but that sounds right to me.

>-Does APRS set up the LPATH _and_ UNPROTO???

DosAprs will set your UNPROTO, but I don't think it will set the LPATH.
Also, LPATH is only used when the Pico sends a Gps packet.  Your Aprs Gps
packets will go to the UNPROTO path.

>As you can see, I'm trying to figure out the sequence of events to

I received this message from a potential APRS user that attempted to download
the latest version of APRS, but instead managed to erase or corrupt the
version that was there. Read the message below and it will tell you how it
got that way. I have since uploaded a new APRS77b.ZIP file but wanted to let
everyone know that the date on the file will be of course todays date, but in
any case everything is fixed now. I have deleted his name and callsign from
his message.

>
>-Does the GPS forward posit data at the rate set by LOC or by APRS'
>POSRATE or _both_?  Someone mentioned "both" but I wanted to be sure.

I thought I answered that thoroughly before.   When using a 2 PORT unit,
it follows the following timing:  When the PICO does not see a CTRL E
for the duration of a LOC time interval, it sends a position via the
LPATH route.  As long as APRS does a CTRL E often enough, the PICO will
not send its own tracker beacon.  By the way, the automatic- pico
originated position has a "/" symbol in it.  The APRS initiated one has
the "@".

>-Operation is in HSP mode, right?

Yes.  and APRS must have GPS option purchased/enabled

>-Does HSP force a transmission as well as get the current posit with
>the
>LGET $05 (F8)?

No.

>-Is APRS issuing the LGET to get the data at the POSRATE rate?

Yes

>-Does APRS set up the LPATH _and_ UNPROTO???

It sets up UNproto, but does not set LPATH  unless you put it in the
INITTAPR.TNC file in the system subdirectory.
Remember LPATH is only what it uses when it is NOT getting CTRL Es and it
has become a tracker.

>As you can see, I'm trying to figure out the sequence of events to

Jon-

I am visiting in San Diego (N4NEQ-9 with GPS)  I see you in Malibu and
tried to message you today.  I am not sure which GATE is carrying all the
traffic, but I think it may be the one to the EAST (right under the DIGI
star).  I'll try to ask some locals.  Having 2 gates locally can put a
strain on both HF and VF sides of the net.

Your path to reach th gate here just needs to be 1 wide.  I hear your
station thru 1 wide.  To go out on HF, you use WIDE, GATE.  To go out on
HF and then back to VHF, it woulfd be WIDE,GATE,GATE,xxxx-x    where
xxxx-x is the local VHF digi on the other end.  If you replace xxxx-x
with WIDE, then you'll go out 1 wide from each other GATE.  It is frowned
upon to put 2 WIDEs on the other end.

Your existing path, WIDE, GATE, WIDE will do nothing but get you onto HF.
The wide after the GATE means nothing.

You can only get an ACK back from aq station who has an @ in their P List
entry.  Press P and look.  Stations with / or !  cannot "talk".  I think
Bob was adding W and M for "talkers" as well, but I haven't seen any of
them.

My car unit reverts autmatically back and forth from / to ! as I remove
and replace the laptop.  Feel free to message me if you see me out moving
around.   I'll be in your neck of the woods after next Friday.

Ralph

```
Thanks to Tom Clarks's dgps broadcast and Bob Bruninga
getting the 300' WB4APR-1 digi in Annapolis back in
```

commission, we now have good differential gps data
on APRS over a good part of the Chesapeake Bay as well
as inland. Down at least to Pax River according to
Tom (the other) Clarke.

I spent the weekend sailing and was able to get near
100% solid copy of W3IWI digital packets on 145.79. They
were frequent enough to keep a pretty constant dgps
correction in my ancient Motorola Traxar +, all the
time getting the usual APRS traffic and not clobbering
the freq. Some of my non-ham sailing friends were
impressed (I bragged, of course) and were thinking
about getting a TNC & scanner. Which is still cheaper
than that gawdawful USCG lf system.

The only problem was this afternoon when I went
stand alone, and operated my Paccomm Handipacket in
GPS mode for a while. I was able to broadcast my
uncorrected GPS posit OK, as verified later from
my APRS rig at home, but the dgps correction never
made it into my GPS receiver. I assume the TNC was
blocking all input to the GPS, which is pretty much
as they tell you, but it is a problem - or software
"feature". On the other hand, the faithful little
TNC operated all day on its internal battery, which
saved yet another piece of the power cord jungle.

Well, I plead guilty to LOCing every 3 this weekend while trying
out the differential correction signals while marine mobile (fancy
for out sailing in the sunshine). At the same time the dgps corrections
were also coming in over 145.79. One would think that APRS would
be clobbered by all that QRM, especially in the pretty active DC
area. But when I got home tonight I checked the tracks from my
home APRS rig, and all seemed normal; all the usual suspects were
still there. I'm not sure what LOC I'll be using out sailing now
that I see how well it works; after all, at a snappy 5 or 6 knots
watching me move along is like watching grass grow, but I'm not
going to feel bad about frequent posits. After all, updating
your house moving along at the speed of continental drift shouldn't
be necessary more often than once an eon or so :-)

I was wondering if there are any UHF networks up and running 9600 Baud
yet. I see i big push in the Southeastern states for it but not sure yet
on the frequency since 445.925 is in GA maybe a problem, so i guess the
freq is still up in the air right now. I was asked to participate and
just wondered if there are others and what freq is being used.

Bob Kirk
N3OZB

Bob,

I'm going to check with our programmer today, but I don't think the GPS
mode blocks the received data from going to the GPS receiver. I'll provide
an update.

However, If I have it wrong, a solution is near to hand. In our dual serial
port commercial products the TNC code looks for UI frames addressed to
DGPS. Those frames (only) are sent to the GPS, and the rest are sent to the
regular serial port.

That feature will soon be released into PicoPacket code. It could be added
to the one serial port models such that if the UI to DGPS is heard, the
data is forwarded out the serial port, otherwise sent to the bitbucket.

> wide, in 77 i have not been able to do that...

APRSdos REPLY/COMMENT: I removed that code, because the proper way to set up a WIDE is with a TNC that can have multiple aliases or callsigns. This way, APRS can always set MYA to RELAY and it will NOT mess up the other callsign that you have set up for WIDE. Just set the second call of your TNC to WIDE using the OCT mode in APRS and then the TNC will remember it forever... BUT make sure to put the words WIDE-RELAY in your POSIT COMMENTS so you show as green.

Has anyone else thought about resurecting one of the old, non-WARC transceivers that are available on the used market for $200 to $300 and converting it to 30 meter operation??? At a recent hamfest, I saw 5 Yaesu FT-101's in that price range and an article in a back issue of QST describes the mod to put the beast on 30. Then you would have a 200 watt rig with a VFO to boot! As soon as I find that old article, I will let this sig know (think it's in the September 1983 issue). I have only

persued the mod for the Yaesu since there is an FT-101F in my shack that
works very well on all HF digital modes, including packet. There should
be information to perform this mod on some of the other old rigs out
there somewhere.   If you are concerned about drift (something mine stops
doing after a few minutes) there are two slots for crystal controlled
channels in this model that would make it 'rock bound' and drift free.
btw> This rig may be a little large and power hungry for most mobile
applications, but there are others to consider. I'm just using what is
available...

> Also, how can I tel which of the two San Diego gates is relaying a particular
> DX transmission?? And is that information even important to know?

APRSdos REPLY/COMMENT: Several comments:
1) I hope you are not doing this regularly.
2) W,G,W is useless. W,G gets you to HF, but then there is a W on the
end.. What good is that W on the end?
3) Matching the HF stations G,W is useless because you have to REVERSE the
path to WIDE,GATE.
4) THnk about it. If you dont know the path, and you are using
WIDE,GATE, then your packets may hit BOTH gates, and they will BOTH gate
your packet and they will BOTH collide, and noone will hear the packet at
all, and all you are doing is QRMing the network for no good... If you
feel you must violate the recommendations and send your packets from VHF
to HF, then use the SPECIFIC digipeater that links you to the gate, not
the generic WIDE...

Please read and understand the section in your
TNC manual about digipeating and rad the APRS README\DIGIS.txt file...

Some info I should have included in my previous message about modifying
Yaesu FT-101's for operation on 30 meters. I have not tried this
modification yet...

==
copied from the internet:
From: laduke@hpdmd48.boi.hp.com (Terry Laduke)
Newsgroups: rec.radio.amateur.misc
Subject: FT-101 Mod for 30-meter (10MHz) Transmit

  I made several of these mods about ten years ago but I
am a little fuzzy. The FT101 uses 10mhz for its WWV position but
they left out the driver and final coil connections in the
transmit section of the radio. So you either add coils or you

can jump the band switch in the driver portion and the final
section.
     Connect a jumper from the 20meter driver coil tab, to the
WWV driver tab; and the 40 meter final coil tab to the WWV final
tab.
     This will make the driver tune in the 40meter position and
the final will dip around the 20meter position.
     A cheap mod for another band, Good Luck but remember that
packet or rtty is continious power so you need to back off the
drive to about 1/3 normal or you will cook the finals!!!!!!

Hi Bill, yes it looks like there is a lot of interest right now and several
digis are planned and ready to go except for the frequency. Looks like
Georgia may have some difficulty with 445.925 since the coordinating body
their claims this as repeater territory ;-). But of course Alabama doesn't
doesn't go along with the Georgia coordination, so right now it's a wait
and see thing.

This becomes a problem with people using older TNC's that will not except
a second alius..  This problem is NOW causing our OCala Digi problems as
he has an old tnc.
Is there a better way of doing this or should we revert to the older
versions od APRS with the older tnc's?

Hello and thanks for reading this..

 Are any of you mapmaking Guru's up to making a good street level APRS
 map of Savannah/Chatham county Georgia??  If so please contact me via
 Email and let me know what you would charge for this kind of
 service..

 Thanks,
 Don AE4BR

I plan on doing a Thru-hike of the Appalacian Trail next
year. My APRS/GPS mobile is hoplessly too large to consider carrying
on a six month hike. Whats the smallest, lightest gps/tnc available
now? It shure would be neat to plot my 2000 mile hike from Georgia to
Maine via APRS!  My budget will probally not let me purchase such a
system.   However I would still enjoy getting some more info.

               Also for fellow map makers, the Trail was hiked with
GPS this year. This weekend at Carlise, PA there is a Gathering of
Long Distance Hikers. At this event  I should meet the fellow that made
this gps-hike and inquire about getting the data for us mapmakers.

why don't we try and use a 20m packet freq for trial aprs?  i have been using
the mfj-9420 ssb/cw qrp transceiver and have used this rig successfully on
ssb, cw and packet/amtor/pactor/rtty, etc.  this rig is under $250 and puts
out about 12w PEP.  i have worked all over the country using this rig mobile
with only a 20m hamstick.  if we ever get a permanent aprs freq on 20m, we
can always put in a crystal controlled oscillator for better freq stability.
anyone else have any thoughts on this?
might also be able to convert this rig or the mfj-9440 40m ssb/cw rig to 30m
if you want to keep hf aprs on 30.

Here is a possible solution:

The MIM Module is a tiny (1"x1.7") transmit-only TNC ($90). Attach
it to your 1 watt Agrelo HPVFC transmitter (0.4"x1" -- $129) and plug in
your favorite GPS (I use the Garmin GPS-45) and you are packet mobile.
The MIM Module will also accept 5 analog inputs (8-bit resolution) and
8 digital inputs and telemeter this data back to home base. All transmissions
are in APRS format. The telemetry inputs could be used to signal emergency
conditions if you set up some scheme with those monitoring your progress.

The MIM Module is available from Clement Engineering, Inc. (410-268-6736).
The HPVFC is available from Agrelo Engineering, Inc. (518-864-7551).

Hope this helps.

Will Clement, N3XLM

```
Tom,
You won't get anywhere 1 meter with dgps corrections sent every 20 seconds,
and to say that the data will be better than DCI or the coast guard is way
off.  DCI outputs corrections every 2 seconds, and the coast guard is much
more frequent than every 20 seconds.
A second delay will add at around 5 meters of error.  The other thing to
watch is whether you send type 1 or type 9 corrections.  Experience is that
sending type 1's over the air is a problem, as any error in the data ruins
the correction for all the satellites in the type 1 message.  In your case,
the data will then be 40 seconds old upon receiving the next packet.  If
you haven't already decided to use type 9's, I suggest that you should.
I tried DGPS a little in the bay area, and found that the delays could be
rather long.  What have you found?
regards,
Ron Haley
President and C.E.O.
DCI

Gosh sure appreciate it if you would fix your mailer Will so we don't get
that WINMAIL.DAT file along with your message. Thanks in advance.

The MIM Module seems to be very useful for many APRS apps. Is there any
operations/configuation info on-line beyond that in TELEMTRY.txt?

After reviewing the documentation I still do not understand how to setup
the aprs system with the weather station.  Currently I am using version
77b of your program.  Do you have available to the novice user any
documentation that would explain how to set up and run your aprs system
as a weather station.  I have registered copy as well as a registration
for GPS and WX.  Any help in this area would be greatly appreciate.

Sincerely,
Bruce Stewart, N9GKE

Hello to the Sig.. Foll info ref recient replies via Gates. May be
of Info for Mac/WinAPRS users.

QUOTED FOR INFORMATION AND GUIDANCE.....
   ************************

HF.txt 7.1b              HF APRS BOAT AND RV TRACKING NET
DOS. README.DIR, File: HF.TXT  Quoted in part.........By WB4APR....
                     *************************
QUOTE:

GATEWAYS:  By assigning the generic callsign of GATE to the gateway
function
in the dual port Kantronics or AEA TNC's, any HF station can gate-way
into
the local VHF net.  HF stations can probably use the VIA path of GATE
most of the time, because the slow HF operation could hardly clutter up
any
local VHF APRS networks.  But users on VHF APRS networks should NEVER use
GATE on the VHF side of their gateways except under extreme
circumstances.
This is because there are hundreds of times more VHF users than there are
HF
users and the 1200 baud users would totally saturate the HF net!

     To repeat:  The purpose of HF/VHF gateways is to permit VHF local
area
APRS nets to see the movements of nationwide RV and BOATER mobiles.  For
example, when I go GPS mobile, I do not want to leave my HF station
running
at home so my wife can follow my status.  But If I send my HF mobile APRS
reports via the local HF GATEway, then my wife can see me on our computer
which only needs to have a VHF TNC.  Please DO NOT GATEWAY from VHF
through
a gateway ONTO HF except under very unusual circumstances!  Similarly, if
you are on HF, only use ONE WIDE after the GATE so as not to clutter up
everyone's VHF nets.
     *********************************

Hi Jim,

The site's still at
http://tbcnet.com/~davidc/aprs.html

but I really don't know who's running it now.  The last I heard, David
Chesser wasn't keeping it up, and according to what it says, Henry N9WMM is
now the pres of NIAN, but there's no mention of Ed Rogers, Dave Chesser, et
al, who were the motivations behind APRS around here.  Seems to me that it
ought to recognize some people in this area.

My site was a 1st time effort to get into web pages.  It'll be going thru
some major face lifting soon.

I'm hearing you now about 4 miles NE of the NE corner of Baltimore City,
about three miles from I-95 exit 67.

I am currently not online enough to depend on for digi, and my signals don't
hit wb4apr-1 very often.  I think I'm colliding a lot with many others, and
my 5 watts don't go far in a competition.

Doug

Richard,
Unfortunately you don't have a uniquely bad Garmin45. I purchased one over
the weekend, and after a few days of testing, and discussions with Garmin
Tech support, I have concluded that the product is totally unsuitable for
use with APRS.
First, it is a single channel receiver, and multiplexes between up to 8
satellites. Unfortunately, any sort of tree coverage causes it to lose
lock on all the satellites.
Second, reacquisation after losing lock when you are mobile is problamatic.
 I have had three scenarios;
a)   Message Poor Coverage followed by the unit turning   itself off.
b)   Message Turn unit off to reinitialize
c)   Unit locked up
Not once have I had the unit re-acquire satellites by itself in a mobile
environment after it has lost them all.
If anyone else has had similar problems. or has a solution let me know.
Garman technical support wasn't able to help with c) above. However they
think that a) and b) are normal. Unworkable in an APRS or in almost any
environment.
I am going to try tha Magellan next.

Can't say I've ever experienced what you are describing, even before purchasing the Trimble antenna from Paccom. After purchsing the Trimble antenna, I was able to use my Garmin 45 for trail mapping in DENSE East Coast forest cover. Never once did I get a "Poor GPS Coverage" message or have the unit fail to lock on the birds while horseback riding through the forests (Trimble antenna mounted on top of my riding helmet). Before purchasing the Trimble antenna, I used a Radio Shack window mount to remotely mount my Garmin stick antenna outside of the truck and without any amplification, never experienced such problems as being unable to lock onto the birds but it would give an occasional Poor GPS Coverage message due to poor signal strength.

> I am going to try tha Magellan next.

If you want a consumer grade parallel receiver, go for the Eagle AccuNav. I beleive that the Magellans are no better than the Garmin.

Just a comment regarding the Garmin GPS-45 that was just slam-hammered. Are there problems? Yes. Are they because the receiver is not any good? No. I would say that the person that just posted this message has gotten a faulty unit and should return it post haste to the place he got it for a replacement.

I have been using the 45 for six months now in a mobile environment. I have experienced some of the quirks but they are by no means COMMON occurences. They are minor bugs that I am sure will be cleared up.

It is my understanding that the 45 is an eight CHANNEL receivers not a single channel unit. I may be wrong here but I've got some very tight relationships with Garmin these days. (See the KCAWG Web Site @ http://home.sprynet.com/sprynet/ku0g for information)

I'm not a Garmin employee and have no interest in promoting their product(s) but to say that it is totally useless for APRS is absolutely ridiculous. These are fine receivers and we have to remember that these are NOT military or aviation units but general consumer units.

Garmin fully supports APRS operations. We ARE a priority to Garmin. If it were NOT so then the Kansas City APRS Working Group would NOT have units consigned to it by Garmin for public service work and there would be no partnership for development and beta testing.

Just a word, in general, to the SIG....

There are some VERY exciting developments taking place at Garmin that will have a profound effect on APRS operations if all goes as anticipated. I can divulge nothing further at this point so please don't ask. To say the least, if this project flies then APRS usage will literally EXPLODE!!!

Wait, watch and listen....

Mark... Try the Anne Arundel Radio Club at 147.105. Check in
on the morning commute net or weekend boating wx net at 11:00am
and 3:00pm. Welcome anytime. It's in Annapolis and covers the
DC & Baltimore areas.

The only decent 440 around is 442.300, also in Annapolis and
run jointly by the Maryland Mobileers & AARC. Good coverage
but not much activity.

By all means bring the tracker. Bob Bruninga's digi is on a 300'
Navy tower just across the Seern and you can pick it up with
the fillings in your teeth. Good APRS coverage; we'll be looking
for you at the boat show. (What's a Tennesseean doing near the
water?)

Cheers,
Bob Kirk

I have a Garmin GPS20 connected to an MFJ 1270B with a Paccom HSP
switch all connected to a Toshiba notebook and an Alinco DR590.

I *think* I have set up the program correctly, but when it runs, I
get a message in the upper right hand corner that says "HSP PORT
TIMEOUT". Software is DOS APRS 7.7. What am I doing wrong?

Ron,, Tom,

This is very interesting to me.

>A second delay will add at around 5 meters of error.

Somewhere (don't you love that reference?) I read that the acceleration of
the rate of error from a GPS satellite was on the order of 1 cm/sec/sec.  If
the differential correction message gives both the instantaneous offset and
its vector (rate), and if the accelration of the error rate is limited to 1
cm/sec/sec, then a 1 second delay shouldn't result in 5 meters of error.

I'm probably misinformed.  I'd really like to underatnad the worst case
ratea and accelrations to see how the 5 meter error is inferred for 1 second
delay.

Thanks for any help you can provide for me.

Cheers,

Lyle

I have been very pleased with my Magellan 3000. It performs flawlessly
either on the dashboard under the windshield or with an external actice
antenna. They stream the
$GPRMC statement (NMEA 0183B option) and don't have the reset and other
```

quirky problems that seem to beset the GARMIN 45. Magellan 4000 is a newer
model with newer
firmware and data options. Very affordable.

Robert I have the ultimeter 2000 and use it with APRS.  I had problems
getting my system up and running as I did not set the WX station to the
correct mode of operation.   Be sure you set your Ultimeter to the data
logging mode..  Instructions page 40 if you are using a Ultimeter 2k.

Hope this helps..
Don

I have to agree also, I used a Garmin45XL on a recent trip from KC to San
Francisco and it worded without flaw ... on rare occasion in the mountains
on hills of SF it would report poor GPS or lose site of enought sat's to
work but was using on the dash of the car with no outside antenna.  I didn't
even bother to keep the antenna vertical most of the time ... was always
moving to apply pressure to windshield to stop it from vibrating due to a
poor mount arrangement.

How is the GPS set up? Is it still in power saving mode (the way it comes from
the factory)? If so one of the ways that they save power is if it looses all
of the sat's it will not try to reaquire them until it unit is powered down.
If you turn power saver off it will work as desired.

I don't know the model number, perhaps Gwyn Reedy can help with that, but the
antenna is small, about 1.25 inch square by about .3 inches tall.  It is
purported to have 36 db gain.  I had to replace the ,I think, SMB connector
with a BNC connector.  The antenna cost $50 from Paccom (which is a special
price to ham operators, basically their cost).

I just thought of something, I have heard that some people have exprienced bad
connections in the antenna that comes with the Garmin.  Apparently the center
pin of the antenna connector can twist loose inside of the antenna.

Hope this helps.

Bill,

It was operating in normal mode, <bold><italic><underline>with full batteries</underline></italic></bold>. I changed them to make sure that was not the problem. I returned the unit yesterday for another, and added an external antenna. Hard to tell which of these fixed the problem, as it has lots of satellites. Garmin technical support confirms that

We are in the GPS business we see lots of GPS receivers, and this is the first receiver I have ever seen that can't reacquire after losing lock due to coverage. I believe that any receiver that requires user intervention to reset the receiver is next to useless for APRS. For those who don't think these problems exist let me quote from the manual. "If you have lost coverage and the unit has trouble reacquiring satellites, try shutting off the unit momentarily to reset the unit." Have you ever seen that in another manufacturers manual??? External antennas should help, as the situation will occur much less often.

Hope I didn't say 1 second. 10 seconds adds around 1 meter, and its exponential after that. My estimate is that 20 seconds is around 5-7 meters. If the message delayed further, many GPS receivers will time out, as they have a time after which they consider the update to be old.

Is this the menu selection under OPERATIONS? There is a mode selection for
NORMAL and BATTERY SAVE, but mine is set to NORMAL and I've never changed it
before. Am I missing something else or is that it? Also, does anyone know
what the purpose is of pressing the 4 arrow buttons while the startup screen
is up? Someone told me it a diagnostic mode or something, but I'm not sure.

I put two pieces of velcro in my car. One set - on bottom of Garmin and on
top of steering column: other set - on back of Garmin and top edge of
speedometer lip.

This positions the antenna just above the dash board and the Garmin "sees"
horizon to straight overhead everywhere except what is shielded with the
roof. Sort of behind and up.

Hello Bill kb6lfm,

When r u going to do ur test?

Looking your way this morn I see several stations on 14.100 to 14.090
W8AKF BBS in Bloomington In is very strong wit sig 10 to 20 over rite
now.
XE and 1, 2 and 3 land from the back and side of my beam.
I hve been tuning for you but so far no results......
I hve a 20 mtr mono wit abt 100 watts in ur direction.
I'll set my beacon at every 30 sec near the freq u r on fer while and
see
if anyone hears me.

Dennis -- yes, leave the batteries inside and connect the external power
The 45/45XL will draw power from the external power source, but the
batteries are available as an "UPS" (uninterruptable power source)
in case the external supply has glitches. The 45/45XL does not tolerate
power glitches very well and may have problems re-acquiring, so the
batteries do need to be insatlled.

73, Tom

available at: ftp://sundae.triumf.ca/pub/peter/gps45faq.txt

The latest Garmin GPS 45/40/38 Frequently Asked Questions FAQ
Version 1.082 Aug 30, 1996

Over 150K of must read information for Garmin GPS users.

Section 4.00 covers
BATTERY/POWER:
-How is power selected between the internal batteries and the external supply?
-What voltages do the fuel gauge correspond to?
-Current consumption of a GPS 45 at different external supply input voltages?
-How does BatterySave mode work?
-Rechargeable batteries?
-Other battery/external power options?
-How long is memory conserved without batteries?
-Does the serial I/O consume much more power when it is enabled?

Section 5.00 covers:
SERIAL/POWER INTERFACE:
-External serial/power connector alternatives?
-How do I interface the GPS 45/40/38 to an IBM-PC compatible computer?
-How do I interface the GPS 45/40/38 to a Macintosh?

APRSdos REPLY/COMMENT: APRSxx.zip only comes with the MAJOR maps but it is
always distributed to users including the Xmaps.zip for THEIR area.  You
should get Wmapsxx.zip or Cmapsxx.zip.  I cant remember if Arizona is in
the CENTRAL distribution or the WEST distribution...  I think West?

You will, of course, have to worry about charging your batteries or, perhaps,
consider having a stash of batteries ready for you at predetermined
locations on your trip. My
GPS is way too large, a Garmin 75, but the smaller ones may be ok, such
as the Garmin 45. The radio will be a fairly weighty problem as well.

I have had problems with my TNC losing it's mind occasionally. It
required a computer to set the parameters each time. That would make the
weight problem really miserable if you couldn't make use of the stuff.

It sounds like a really nice trip.

Since most of the trip will be woods hiking, I believe, you will also
have to concern yourself with access to the sky. GPS units kind of like
to see the satellites directly without anything blocking the view such as
tree limbs and foliage. You may be able to get enough satellite view to
get an occasional good fix.

Good luck on your trip,

John W. Wilson, KN4HX

Rendered body type: text/plain

It's me again Roger.

  I'm aware of your QRM problems, and thank you for bringing them to my attention. This
is not going to be a test. I'm here on 20m APRS!

Problems that I can 4C are:

1. APRS on 20M is NEW, and people are slow on the up-take regarding ANYTHING NEW.
   It's our nature to reject change, and to be suspicious of "NEW"..! Takes time for us
  to accept new & change.

2. Criticism! Constructive is welcome, all others need not apply.

3. Frequency to use. I'm going to stay on 14.098.00Khz MARK until I get a "show cause"
 from the FCC. It doesn't matter where one moves to, an APRS presence on 20m is going
to P.O. someone. I have taken ALL POSSIBLE PRECAUTIONS to maintain as narrow a band
 width, and frequency stability as I can. I urge all concerned to use FSK and the
INTERNATIONAL STANDARD of MARK 2125 SPACE 2295 SHIFT 170 in there TNC's.
   I think it's time that APRS went "International". I'm working with Clarry (VK5ACP)
   in Adelaide, Australia, Ted (HC5K) In the Andes of Ecuador, and MATT (WT3C) who is
   the Radioman aboard the USCG Icebreaker "Polar Star" to get their Stations up!

If you, or anyone knows a station willing to try "Something New" by all means, let them know that APRS is on 20m now. I believe if we are going to be tracking Icebreakers, in Antarctica, or "VK" mobils crossing the Nullabor Plains of Australia or a caravan of Llamas in the Andes (Hi!) 20m IS the way to go.

So in closing, I want to thank you for GATEING your local VHF APRS'ers out here on the "Left Coast". And I hope that you can continue to act as a 20m APRS gate.

Cheers for now.

235. GPS-75 lockup

From: Bob Derderian <n2iph@cyberenet.net>
Date: Wed, 09 Oct 1996 20:59:29 -0400
To: APRS dicussion group <aprssig@tapr.org>
Message-ID: <325C4A71.3102@cyberenet.net>
Rendered body type: text/plain

Hello all,

My GPS-75 must be monitoring this SIG, and decided that it was time for it to join in and have a little fun with me, 'cause it today for the first time operating mobile for almost two years was locked up (screen froze) when I came out of work to go home this AM.

I had to remove power from the unit to restart, couldn't shut down from the keypad. And when I restarted, surprise!, all stored information was gone! MY 150+ waypoints lost, along with routes and config params. I may have hit the button below the PWR key when I rebooted the unit, not sure.

Does anyone know what will happen if you press another (or any) key when powering up?

Is there a key sequence for clearing out the memory during reboot?

I seem to remember my GPS-75 going into a diagnostic mode of some sort once also, is there a key sequence to enter this mode. I remember the screen was showing an animated, expanding box with maybe a line of text in the center of the screen.

On the subject of batteries and mobile; I power my GPS-75 from the vehicle, and do not have the battery pack installed, it works just fine.

I use the Garmin GPS-26 antenna, mounted inside on the dash, and most times see 7 or 8 birds at S-5 or better. Prior to the GPS-26 antenna, I used the 'stick' antenna mounted to the windshield with a suction cup, stick-on cellphone mount from Radio Shack on the inside and this worked OK, but would loose lock if not parked with a good view of the southern sky or in heavily wooded areas while traveling.

Since moving to the GPS-26 antenna I have not had this problem, until today.

If anyone knows where I can find a list of key sequences for the GPS-75, I would like to know.

Thanks, Bob

Gosh NOT AGAIN. Some new potential APRS user had deleted or rather corrupted the file that was there so i personally uploaded a fresh copy no more then 3 or 4 days ago. Someone must be deleting the file for some reason. I will upload it again if indeed it's missing.

240. analog interface

From: jclakeland@ucdavis.edu (John Lakeland)
Date: Wed, 9 Oct 1996 20:08:19 -0800
To: aprssig@tapr.org
Message-ID: <199610100308.UAA21116@franc.ucdavis.edu>
Rendered body type: text/plain

```
Hi all,
   Well, I guess I want to ask how you people feel about a generic analog
interface in APRS that could monitor either weather or anything else you
can provide an instrument for. This would allow the development of many
types of monitoring nets such as radiation level, seismic motion, etc. I'm
sure suitable instruments could be obtained to make a weather station this
way.
   Will Clement maker of the APRS MIM has said it would be relatively easy
to produce the hardware using a microcontroller like the MIM is based on.
Alternatively there are numerous existing serial analog to digital
converters that could be used. Of course software support for the chosen
device would be needed.
   As with any development project, it all depends on how many people would
use the thing. There are currently a number of commercial devices supported
by APRS including several different weather stations. They are all specific
purpose devices. One generic device would allow unlimited development of
monitoring systems without further software support being added to the
programs. Seems like a good idea to me as it would let people experiment
```

and develop systems without bothering the software authors for still
another specific support package.
   Of course this will not happen if very few people are interested, as it
wouldn't be worth the trouble. Opinions?

I'm hosting the new site so I I'd like to comment! A few weeks ago my
original ISP was bought out my my current ISP.  This was a very good deal as
the new ISP is a couple orders of magnitude better than the original one.
Just as luck would have it, my new ISP decided to rework his routing tables
the day Jim Duncan (sorry Jim) announced the new site http://www.kcaprs.org
was up.  In the process I lost routing for 3/4 of the day. Needless to say
it did not make any of my paying customers happy either. Hopefully the
situation has been fixed and we should be remain up except for minor down
times to work on it. My new ISP just had a fiber optic multiplexer installed
and has moved all his digital lines to the fiber, this required a little
rerouting of his Cisco 7000. He also decided to move some ISDN lines to a
dedicated Max Ascend box ... the net (no pun intended) result was a little
glitch in routing which affected mostly me (or us!)

Later,
Larry

PacComm's order-only number is 800-486-7388 and the Trimble active GPS
antennas that USED to be $50 are now $65 + shipping.  They are not in stock
right now but will be in about a week. I just ordered 2 more... they work
beautifully with my Garmin GPS-45.  I plan to use then with 2 GPS-20's I
ordered from TAPR for standalone trackers.

 Have fun es 73 de Boyd

247. Re: [APRSSIG:5509] analog interface

From: Bob Derderian <n2iph@cyberenet.net>
Date: Thu, 10 Oct 1996 11:15:34 -0400
To: aprssig@tapr.org
Message-ID: <325D1316.4CB4@cyberenet.net>
Rendered body type: text/plain

I would like to see it (generic analog and/or digital interface).

Perhaps the easiest thing everyone could add would be temperature to their site, using a thermocouple (we're talking mV levels now). It's fairly easy to get or create a T/C (thermocouple). Should be able to get T/C wire at most electricial shops, and the tables for the various T/Cs are easily obtainable which give the temp/mV relationship for its (the T/C's) range. To cal a T/C quick and easy you can just dunk it in a bath of ice/water, ice and water only exist at one temperature, 0 Celceis (or 32 deg. F). A couple lines of code in APRS would let you cal your T/C and your all set to report your local temps across the network.

I haven't browsed the docs the MIM module or about the telemetery screens, so don't know if there is any info there that would be of help.

Ditto!

I have a double problem in that we not only have moved DNS domains but
are also behind a firewall which creates its own set of problems.  It
won't even allow me to change the characteristics so that I only get a
single (large) message per day.

I have also been sent e-mail telling me that I had been removed from the
list, but 6 months later I am still receiving the list.

I have been on the Internet for 10 years and this is the first mailing
list that I have been associated with that is so picky about statement
lines yet does not have a reliable workaround for those cases when the
world changes for a subscriber as it has with Roger and myself.

It appears that the list has no maintainer.
If it did, he/she could solve these types of problems.
This includes your problem, as well as the one which has to do with the
"reply to" field being picked up wrong.   When someone replies to the
sender, it goes to the list, rather than the sender. I wrote to the list
producer and they told me how to fix it, but no one will accept
responsibility for list maintenance. At least that is what it seems like.

Keith Sproul is the "host", but he is rarely seen here anymore and Greg
Jones from TAPR seems to be helpful, but I am not sure is he "controls"
the list either.

WHO CONTROLS THIS LIST?????

Holding the ENTER key while turning it on enters the diagnostic. Hit ENTER
again to see the test display. The signal amplitude reading should be 1600
or better according to the Service Manual.

APRSdos REPLY/COMMENT:  Thats what the MIM is, a PIC with 5 analog
inputs.  It outputs an APRS formatted telemetry packet.  The
translation/calibration is included in additional packets to  tell APRS on
RECEIVE what equation and units to use for the display...  That has been
built into APRS for over 2 years...

APRSdos REPLY/COMMENT: Its the APRS Micro-Interface-Module.  A complete
TNC transmitter on a chip which has 5 analog inputs and 8 digital bit
inputs plus a GPS input.  It will transmit its position (if GPS is
connected) plus a packet with the telemetry in it.  APRS displays the
position as usual, and the telemetry on the TELEMETRY screen.  See the
readme file TELEMTRY.txt  Oh yes, its smaller than a match box...  The
earlieer prototypes were larger, about the size of a credit card and cost
$90...

do?

SNIP

According to Will Clement, as I understood him, the MIM is the TRANSMIT
side of a TNC. It interfaces with a radio, not a computer. I want to input
data to my fixed station same as a weather station. This requires an RS232
interface which the MIM does not have. Otherwise, using the MIM one would
```

have to have 2 radios etc. If I'm wrong I hope Will Clement will get in here and straighten me out. I'd love it if the MIM were already capable of doing this.

APRSdos REPLY/COMMENT: MANY of us on the APRSSIG are looking for a design to use as a single frequency XTAL controlled HF transceiver for 10.151 MHz PACKET. We will want it to output from 20 to 50 watts but otherwise, to be a black box. 12 volts and packet TNC data in, RF out. I think your receiver and exciter boards are perfect, since I think they produce true SSB. Packet is of course just FSK, so shifting the transmit signal should be easy. SSB reception through a CW filter does the trick on receive... I am sending this message to the whole APRSSIG to see if anyone wants to explore these modules as an approach to the HF data transceiver design..

Perhaps the easiest thing everyone could add would be temperature to their site, using a thermocouple (we're talking mV levels now). It's fairly easy to get or create a T/C (thermocouple). Should be able to get T/C wire at most electricial shops, and the tables for the various T/Cs are easily obtainable which give the temp/mV relationship for its (the T/C's) range. To cal a T/C quick and easy you can just dunk it in a bath of ice/water, ice and water only exist at one temperature, 0 Celceis (or 32 deg. F). A couple lines of code in APRS would let you cal your T/C and your all set to report your local temps across the network.

snip

Yep, and a few simple components and an op amp or 2 and you could have temp/volt. A simple board anyone could build from Radio Shack parts would do the trick. Even if you know little to nothing about electronics with the information that could easily be provided by one of us who does, anyone could add such instruments. Another idea I have been working on is an aneroid barometer based on a cookie tin and a linear potentiometer (with associated simple circuitry). The possibilities are endless.

268. Motorola Oncore GPS problem

From: Mark Oppenheim <marko@tetherless.com>
Date: Fri, 11 Oct 1996 10:54:58 -0700 (PDT)
To: aprssig@tapr.org
Message-ID: <1.5.4.16.19961011105505.4d4f22a2@gorgor.pa.tetherless.com>
Rendered body type: text/plain

OK, here's my last try.....

My Oncore puts out the following string:
(This represents the output when satellites are not being received, so
ignore the fact that it's missing lat/lon)

```
------------------
$GPGGa.,<>>>.<>>>.S,<>>>>.<>>>.W,8.<>..-1<.8.M,-1<.8.M,,*52
E
------------------
```

(the "E" is actually a binary character, and is put out AFTER the <CR>, and
at the end of that string and before the next string starts)

I have tried setting the unit to "default" setting using the motorola GPS90
program, letting the unit sit, and even looking for a reset pin inide the unit.

The unit appears to recieve OK, it's just that the strings are mangled.

* Has anyone seen (and fixed) the problem?

* Where do I send the unit for repair?

Mark

Maybe John wants an analog & digital interface to his
PC, for data logging purposes (rather than put
this data on the air)?

APRSdos REPLY/COMMENT:  I would just connect the MIM to the same radio
and who cares if the packet is comming from a different piece of
hardware...  It still looks the same on the air...  Also, then, it will
still report conditions when the PC is doing something else...

Just to calm some of the debate, I have spoken to John
concerning the MIM's capabilities and he understands its
operations correctly.  His needs are for another device --
just as "ttyamada@CCGATE.HAC.COM" noted.

73 de Will Clement

P.S.  Now that I am using Netscape Gold 3.0, I hope I haven't
included that silly WINDATA at the end of this e-mail.  I
would appreciate a personal reply from someone confirming this.

A couple of ideas -- check your serial port configuration. You
should be using N81 at 4800 baud. It looks like you have the parity
or stop bits wrong. The "E" you see is probably a <lf> since the NMEA
message is defined as terminating in <cr>+<lf>.

Unfortunately, I've checked this, and the Motorola program sets all the
comms port parms between the "Motorola Binary Mode" (which the program
reports "data errors" on) and the problem also exists on the motorola.bas
program distributes with APRS.

I have a starnge feeling that getting ths unit fixed will be more than it's
worth...  Maybe I can use the box for a 1W RF deck for 2 meters!

Rendered body type: text/plain

```
It been interesting.  Last friday I left a message about my Garmin45 in the car
just losing the satellites while sitting in a parking lot while I had a LONG
lunch.  I asked if this was a problem with my unit or just happens.
    There have been MANY replies.  BUT the tone of the message sure got changed.
I started by asking if mine was a problem.  It changed to Garmin
bashing/bragging, to.....  There have been so many changes, I am not sure what
the question is from reading the 'RE:' now.  Some have quoted all, some have
quoted some, some changed the topic.  Its like the kids game where you start at
one end and see what is said by the last person in the room.  I am not
criticizing, just thought it was interesting.
    Now to what has happened to me.  I was asked what antenna I was using, the
Garmin external mag mount on top of car.  Not through the windshield.  Did I
have the batteries in.  No I didn't.  Thinking that with external power they
weren't needed. I put them in. Didn't make much difference.  Drove around with
GPS running for about two hours, sitting at stop light looked over, no status
bars.  good view of sky. switch off/on all 8 bars right away.
    Then Bill N. said was the GPS still in 'BATTERY SAVER MODE'?  Will wonders
never cease, it was.  Shows what reading the manual does.  Anyway I went to
lunch again today (Fri), same place, even the same parking place. and YES I did
stay a LONG time.  And when I came out the GPS was still running, all 8 bars.  I
know this wasn't the final test, but its sure a good start.
  THANKS for all the comments I have received, both good and bad, it shows there
are people willing to help on this SIG.

277. Garmin 45 update

From: kc5ejk@onramp.net (Robert Winingham)
Date: Fri, 11 Oct 1996 23:33:41 -0600
To: aprssig@tapr.org
Message-ID: <v02140b00ae84d0ce985e@[199.1.154.160]>
Rendered body type: text/plain

Thanks for the report.
To summerize and a few other points.
:

The Garmin-45 will auto shutdown (turn off) if
There is no GPS data for some periode of time (like parking in
a covered garage. The unit will also shutdown with an internal battery
only supply when it sees low power, thus saving you from a internal
parameter memory loss.

Don't use BATTERY SAVER MODE even when using internal batteries.
It doesn't save much and no reason if using external power.

Use a 1/4 amp fuse if using external power and external antenna.
There is DC voltage on the antenna BNC to power the active external
antenna pre-amp.

Several people have reported it is better to keep a set off internal
batteries in the unit. The internal batteries are isolated, so safe to
use Ni-Cads (External power will NOT charge the internal batteries).

Some have reported there is a slight drain of the internal batteries even
when using external power. I can report that the only time in over
two years of car GPS use that I have seen a lock up and no status bars was
when starting the car with almost dead internal batteries.

The same day I had a complete reset of the internal data. Never had that
problem again when I started using good internal batteries.
(Renewal Alkaline have good bang for the buck)

-------------- My setup -----------------
I use the ICOM HT cigarette lighter 13.5 volt power plug with the
internal RFI LC circuit for external GPS power.

I use the Garmin external antenna inside the car and get a good satellite
lock before moving. High pager RF areas will play havoc with getting
a lock.

The Garmin-45 is a so called dual channel GPS, NOT a parallel GPS.

The Garmin will process data from one satellite while it
reads data from the next satellite. (So they say), but It still
scans the 8 satellites one at a time, like a single channel unit.

Save yourself 20 min of "Searching the sky" and write your
normal local LON/LAT on the unit for use in case of a total reset.

SNIP

Hi all,
     Well it's not exactly clear how one would connect the MIM and a TNC
from a computer to a single radio at the same time, but maybe that can be
done. Still, then one would have a weather station with no interface on
one's own computer. I doubt that most people would like that very much, I
wouldn't. The existing weather stations are supported in the manner I have
suggested at least in Mac APRS, I haven't used the other 2 softwares. There
is a nice virtual instrument panel and data logging and weather history and
maps etc.
     What I am suggesting is that the present approach requires a specific
software support for EACH commercial product. One generic analog interface
would put an end to this requirement and allow an unlimited number of
instruments, both commercial and home made to be used in the way a Peets
weather station can be used now. To quote the read me file Telemetry.txt...

     "The MIM was developed by Carl Wick, N3MIM, as a very simple,
light-weight, throw-away module for experimental balloons."

    As I understand it, the MIM is designed for stand alone telemetry. It
is a great device for stand alone monitoring. It has many useful
applications. It is not, as far as I can see, suitable as the interface for
a fixed station to do what fixed stations currently do with existing
commercial weather stations which have support in the software.
    Somebody please correct me if I am wrong about this. I don't mean to be
argumentative or cause anyone any difficulties, I just don't see how one
can base a fixed monitoring station on the MIM.

GPS Antenna Specs.

These antennas are available from PacComm for $65 plus shipping. They are fitted with an SMB connector which may have to be changed to fit your GPS receiver.

Delivery may take up to 2 weeks after order is placed.

Call 800-486-7388 to order.

73,
Gwyn Reedy
PacComm

New Miniature GPS Antenna from Trimble Navigation

Trimble's OEM Products Group announces a miniature GPS antenna for use with the SVee6-CM3 receiver. The new antenna featurs a 25 dB LNA, small size (47 mm x 40 mm x 13.3 mm, 180 gms.), magnetic mounting, and a 5 meter cable. This weatherproof antenna is designed to operate with or without a ground plane and includes filters for improved jam immunity. List price is $75 when fitted with an SMB connector.

Total specification (through antenna, LNA, cable, and connector)

Frequency Range	1,575.42 +/- 1.023 MHz
Gain	23dBi MIN (on 65 x 65 mm ground plane, -40 to +80C)
Noise Figure	1.6 dB MAX (+23C) 2.3 dB MAX (+80C)
Output Impedence	50 Ohms
VSWR	2.0 MAX
Out of band rejection	+/- 20 MHz 7dB MIN +/- 30 MHz 12 dB MIN +/- 50 Mhz 20 dB MIN +/- 100 MHz 30 dB MIN

281. REMOTES ?

From: Peggie Buckles <willy@mcn.net>
Date: Sat, 12 Oct 1996 12:00:57 -0600
To: "'APRS SIG'" <aprssig@tapr.org>
Message-ID: <01BBB835.33FFCC00@rgpm01-045.MCN.NET>
Rendered body type: text/plain

Hello fellow SIG'ers.

I need some info on a "remote beacon".

What I want to do is put out a few gps/tnc pairs in different vehicles. Then be able to track them from one "command center".
This is for the local, county search and rescue unit.
What I want to know is if I can have several of these "remote beacons" all under my callsign ?
I would suppose that I can just have a different secondary Identifier on the end of each callsign for the different "beacons" !??

ex. Beacon one - KI7NV-1
Beacon two - KI7NV-2
Beacon three - KI7NV-3

ect.....

One more thing...   I wonder if anyone has a fairly detailed map of south eastern Montana ??   Or knows where I can get one ? Particularly of Rosebud county.

Any help would be greatly appreciated...

Tnx, Willy, ki7nv

282. Peet U-2000 / WINAPRS Setup

From: BordingK@aol.com
Date: Sat, 12 Oct 1996 14:24:07 -0400
To: aprssig@tapr.org
Message-ID: <961012142406_208862798@emout03.mail.aol.com>
Rendered body type: text/plain

I', baffled, but that's not too infrequent!

Need help getting this blasted Peet U-2000 to talk to WINAPRS.

Peet U2000:
1. Their cable from U-2000 to COM2
2. Data Logging Mode as per a messge on the SIG
3. In Windows Terminal this is what flows by:

```
!!0037000602F2030727FC032C02E2----00FF037E00000064
!!0037000602F2030727FC032C02E2----00FF037E00000064
!!0037000602F2030727FC032C02E2----00FF037E00000064
```

WINAPRS:
1. Registered Copy
2. Ver 1.1.3
3. Settings: Auto Input, WX On,
4. Serial Port: COM 2, 2400 baud 8-1-None (just like in Windows Terminal)
5. Posit Rate Settings (Little confusing, since there are 3 HFs and 3 VHFs under Weather Report, but all are set at 15 min.
6. Weather/RDF Settings: Peet U-2000, .01 inch rain gauge.
7. Weather Port OPEN (Do you have to reset this each time WINAPRS is started, I can't seem to save that setting!

Click on Send Weather, Wx packet goes out with 000000's
Nothing shows in Weather List!

What Gives? Any help will be appreciated!

>What I want to do is put out a few gps/tnc pairs in different vehicles.
>Then be able to track them from one "command center".

APRS calls these Remote GPS Trackers as they have no computer. They can have a computer attached to run APRS software so the remotes can watch the action or send messages.

This is done all the time for special events.

Name them what you want ,callsign-0 to callsign-15 is a standard.

>From APRS DOCs SYMBOLS.txt APRS DISPLAY SYMBOLS

SSID	SYMBOL	SSID	SYMBOL
-0	Dot	-8	Ships (power)
-1	Ambulance	-9	Cars
-2	Bus	-10	Space objects
-3	Firetruck	-11	Balloons
-4	Bike	-12	Jeep
-5	Yacht(sail)	-13	RV (recreational vehicle)
-6	Helo	-14	Truck
-7	Aircraft	-15	Van

"Secondly, you may indicate the desired symbol character surrounded by braces {s} as the first 3 characters of the TNC BText. Once the BText has been received by a station, the mobile will then be displayed using

```
the specified symbol.  The advantage of this method is that more
symbols are available than from the SSID convention.  The disadvantage
is that the symbol is not displayed until AFTER at least one BText is
received."

Short example (See docs for more)

a - AMBULANCE
b - BIKE
c - DX spot by callsign
d - Dual Garage (Fire dept)
e - SLEET
f - FIRE TRUCK
g - GALE FLAGS
h - HOSPITAL

-----------------------------------------------

If you set the TNC to ID beacon your call each 10 min, then you can
use what you want for the TNC MYcall sign label  ie   Fire, Air, Food

I would use a TNC like a KPC-3 so you can remote control the
TNC over a radio. This makes you the control operator :-)

Sure!  You could set MYCALL to AMB1, AMB2, TRK1, TRK2, etc.  THEN make
BTEXT {x} KI7NV Tracker Ambulance 1
BTEXT {x} KI7NV Tracker Ambulance 2
and so on....where x is the symbol designator from symbols.txt (for
example "j" for Jeep).  As long as you set the beacon to not more than
10 minutes, you will have met the identification requirements and
uniquely identified each.

This Station is under automatic Control..  I don't sit at my Digi
Sites all day and watch or "drive" them at all.

Nothing wrong with what he is up to.  Nobody will be "using" his
equipment.  It is Telemetery and perfectly legal.

Sam.

I would like to let everyone know that I am alive.

Unfortunately several events recently happened.  My car was stolen, and
then I got very ill.

Some of you know I have been battling a lung disorder for several years,
that has caused me to be in and out of hospital in the  last week  or so.
  Several points I need to make

#1  Shirts:   first load of shirts were mailed this week. You should be
getting them within a few days.   There are more shirts on order and I'll
get those this friday and mail them saturday. This will complete the
pending shirt orders.  If you don't get your shirt this week you get it
next week when I pick up your size at the store. ( I ran out of mediums
and large)

#2 GPS products etc:
ALL GPS/Radio stuff that I sold (to pay for getting my car back and since
no insurance, to pay for my medical expenses)  was shipped  today.   I
```

was under the impression that my mom sent the stuff out, but she did not,
which I found out today. You should recieve all items this week, as I
personally took it to the pack and ship and its going out UPS.

I am sorry that I dropped out like that, but as some of you know, my
illness required me to be in the hospital and I will be getting my lung
tests this week, I would appreciate your prayers.

Should you have any questions, please EMAIL me at my new address
KD4EMI@Juno.COM

I would like to thank you for your understanding and am sorry if my
dropping out caused any anxious moments.

Mike KD4EMI

Thanks Carolyn, i keep posting this oever and over but people don't seam
to want to do it the easy way Hi. I have even made it better now by
highlighting that URL in all upper case and in WHITE to make it easy to
find. It's located on page one with the following address so you can
bypass all the other pages.

http://www.concentric.net/~wa8inz/PAGE1.HTM

```

I could use some help.  I am running my APRS system in my car.  Garmin45, KPC-3
V6, DR1200 radio, laptop.  The last couple of times out in the car the system
sent fine but I never saw on my screen any of the stations that heard and sent
back to me.  This includes my home station when I was at the end of the block.
The car system did hear at one time, I don't know what I changed in the TNC.
   Would someone tell me what, and to what, settings they change in the KPC-3
```

```
from the defaults that come in it?

Thanks.   73  Richard  N7Rig

Rendered body type: text/plain

```
An most satisfactory GPS active antenna can be built for less than five
bucks and about two hours effort.  The patch antenna in the October 1995
issue of QST works very well.  It works much better when a MINI-CIRCUITS
MAR-6 preamp is included as part of that antenna.
    Two models of the patch antenna were built using flashing copper
sheet usually used by roofers.  This fifteen thousands thick material
bends and cuts most easily but is difficult to solder.  None the less
fashion per the QST instructions making only as large a hole as necessary
for the former coax tap connection on the upper plate and an insulated
passthrough hole in the ground plane.  The first model included the
MAR-6 MMIC between the plates while the second soldered the chip below the
ground plane.  No difference was noted, however the second was far easier
to construct.  An ordinary 100 ohm carbon composition resistor with a 470
pf ultra miniature cap across was placed between the output pin of the
MAR-6 and the coax center conductor to the Garmin 20.  Possibly the use of
better components would help, but the IC produces some 15 db gain at 1575
MHz, so some mismatch can be tolerated.
     The copper plate requires a large soldering iron (that's why author
W1GE used aluminum and conductive tape!).  Pretin two solder spots where
the MAR-6 grounded pins are to go and simply be satisfied with a cold
solder joint when assembling rather than trying to be "elegant" about it!
     Remember to insulate the patch as about 1.5 VDC appears there.  Also
insulate the center coax from the Garmin 20 as well as 5 VDC appears too. A
simple upside downplastic salad bowl completes the design.

302. javAPRS update

From: Steve Dimse <sdimse@bridge.net>
Date: Sun, 13 Oct 96 18:06:36 -0400
To: <aprssig@tapr.org>

Message-ID: <199610132202.SAA25042@bridge.net>
Rendered body type: text/plain

For all javAPRS users:

Version 0.8b1 is up on the TAPR site. If you are using javAPRS on a web page, please upgrade to this version. 0.7b4 was not correctly displaying stand-alone trackers (fix one bug, add another!)

I am back to work after my trip (working 17 of 19 nights, 12 hr shifts) and short on time. I don't plan to do much work on javAPRS for a while, I will be spending what programming time I have on APRServe.

Due to multiple requests like "when did you see me on your trip" etc, and my lack of time to cull the answers from the log file, I will make my log available on the TAPR FTP server once I get a chance to pull it all together. There will be two files, one of the raw data and one thinned with a program that should remove most of the dups as well as the non-posit report stuff like beacons and messages (the raw file is abt 2.3 MBs, with 470 stations heard).

73 de Steve

In Version 77c the digi path command was changed (Why i don't know) but i noticed many many users are having problems finding the new command including myself, I think some one gave a multi key command for this but it got lost. I have seen some go back to an older version because of it. I noticed ALT-B doesn't do anything now so why was it changed?. Sure would be great to be able to get an updated list off all APRS commands.

305. Newbie GPS Question - Antenna

From: Donald Rotolo <73227.2644@CompuServe.COM>
Date: 13 Oct 96 23:37:46 EDT
To: APRS SIG <aprssig@tapr.org>
Message-ID: <961014033745_73227.2644_EHM28-1@CompuServe.COM>
Rendered body type: text/plain

OK, I've gone and put the GPS-20 kit together, managed to get some data out of it, but still haven't got a fix yet. The problem is the antenna.

Bob Bruninga's comments included with the kit say "To see it work, stick a tiny 1.8 inch piece of wire into the antenna jack, take it outside - you should have no problem getting a fix..."

Well, I went one better (I thought) and built a little ground plane - a 1.8" piece of wire (the center of the RG-174 coax) sticking out of a ground plane (a 3.6" diameter disk of PC Board material). Took it outside, nothing. Well, it kept finding one satellite (the $GPGSV sentence said), but not much else. So, I took it to a better spot (lots of tall trees where I live), and it began listing 8 satellites - the az/el data was there, but no C/N ratio - obviously, it wasn't tracking. My conclusion was that there wasn't enough signal.

So, I stopped at my local boat store, and saw the nifty little antennas that come with the Garmin units, but they didn't sell them (are they available?). All they had was another Garmin antenna, for roof mounting (on a boat), but it cost $129 - more than I care to spend, or can afford.

So, I looked around and found a description of a quadrifilar antenna in the ARRL Antenna Book - and built one. Or, what I think is one, since the construction details in the Antenna Book are quite vague. Unfortunately, I don't have easy access to any of the articles cited in the references to look up the details. I had to put a tiny chip cap in series with the center conductor, to avoid shorting out the antenna supply. Anyway, it didn't do any better - just the 8 satellites in view, no C/N, no fix.

Then I built a crossed dipole (the tiniest one I ever built), with a nice ground plane, just like the one in the antenna book. Again, no fix.

The satellite az/el info keeps changing, so I figured something must be getting through. As an experiment, I put a dummy load onto the antenna jack - did the same thing. Now I wonder if it is really seeing those satellites, or just guessing due to some info it got briefly sometime in the past.

Now I'm at a loss.

Question: Can I get an antenna for this thing for less than $40? Where? I live in the NY City area, so if it exists, I should be able to get it.

Question: How about building one? Someone mentioned that QST or 73 had an article on this in the past year, but I throw out the magazines when I'm done (or I'd be buried in paper), and couldn't find it. Any suggestions for an antenna? (I'd rather buy one, but building isn't a problem if $129 is what a commercial one costs).

Another question: I've tried to send data to the GPS 20, to tell it to stop sending some of the sentences I don't care about, but it doesn't seem to get the message. I noticed that everything has a checksum (?) at the end of the sentence, preceded by an asterisk (*) - since I didn't see how that is calculated, I didn't include it. I am supposing now that it is required, so how DO I calculate it?

And, the final question: Does WinAPRS care which sentences are sent to it by the GPS, or does it ignore what it doesn't need or use? In other words, should I just forget about turning off some of the data stream, and let APRS deal with it?

I'm really anxious to see this thing work, and find out just where I really am.

73,
Don Rotolo N2IRZ

Richard-
First and foremost:  Make sure you input the command  INTERFACE NORMAL so
the TNC knows more than just its "name,rank, and serial #"
```

The rest of the commands will be set when you bring up APRS. Tell APRS you have a TAPR TNC.

You might have missed the times I posted to the sig that people having GPS fix problem should run Bob's SIGPLOT basic program that is part of theAPRS doc file. If you have DOSaprs there is a GPS sky plot there also.

With SIGPLOT you can see what is going on with your unit.

If it keeps cycling in numeric order from one sat to another it is not getting a fix. Onec it find three satellites then it downloads the sky chart at 50 baud which takes at least 20 min sometimes longer.

You might need to wait hours if the satellites are not overhead. Once the chart is loaded and a corect lon/lat/alt are in, the next fix is faster.

I don't remember if the winaprs version has the sky plot working, I use MACaprs or DOSapr smost of the time. The SKY chart has disappeared from the latest MacAPRS program so use a older version.

Borrow a Garmin passive or active Antenna for the first fix.

Those az/el are bogus until the unit has the correct Keps installed. Otherwise it is just looking where is THINKS the satellites are.

There is a chance that if you use the input port to load your correct location/time/alt you might get to skip the downloading of the satellite sky chart keps and get a faster fix. Works on a Garmin-45 but have not tried on a Garmin-20

The checksum is the XOR of all characters between $ and * (excluding
those
characters).  It is a single byte which must be sent as two ASCII
characters.
For example, to disable all messages, send the string:
        $PGRMO,,2*75<cr><lf>

<cr> is the carriage return:  0x0D
<lf> is the linefeed:  0x0A

To enable only the GPRMC message:
        $PGRMO,GPRMC,1*3D<cr><lf>

It is much easier just to use PC board material.  The ground plane can be
double or single sided, but the patch must be single sided with the copper
side facing the ground plane.  You can carve out little lands using a
knife to solder the chip..

APRSdos REPLY/COMMENT: Alt-B has changed to INPUT-MY-STATUS to be more
consistent with INPUT-MY-POSITION.  See the NEWNOTES.txt which comes with
each new version of APRS...

If there is a problem in the OPS-DIGI command, tell me about it.  There
were no changes made in that area...

I wonder if that could be told to the other Garmins as well as the GPS 20
module?
I have a Garmin 90 and it spits out tons of information. I haven't seen any
information on requesting specific data from this unit. Does anyone have a
copy of the GPS 20 instructions that I could  look at?

In using the Trackpac 35, which uses the GPS 25 engine, I find that the
checksum is not required for those commands (the ones that start and stop
sentences)

Using procomm or another term program, or possibly even APRS terminal
mode:  Just give it the info it needs, followed by C/R (I use the "Enter
Key)  and LF (I use CTRL J).  The checksum wasn't required and if
specifying ALL to be disabled or enabled, the  parameter thaty specifies
the sentence can be left blank.
```

```
 For example, to disable all messages, send the string:
      $PGRMO,,2   <ENTER  <CTRL-J>

To enable only the GPRMC message:
      $PGRMO,GPRMC,1  <ENTER> <CTRL-J>
```

In speaking of messages sent to the GPS-20, Dr. William I. Clement wrote...

> <cr> is the carriage return: 0x0D
> <lf> is the linefeed: 0x0A

This notation confuses me, for two reasons: First, I think of CR and LF as single bytes, represented by two hex characters, 0D or 0A, and you show four hex characters. Second, the messages coming out of my GPS-20 seem to have only a single byte (0D) following the checksum.

Folks :

We got caught (in my case, again) by not reading the instructions; i.e. the newnotes.txt in the readme file.

When I got 77c up and running yesterday, I noticed also noticed the lack of VE3 mobiles; I assumed that we were all being stuffed with turkey and merely not mobile. (Wrong) I read Ron's note this morning and went and tried and experiment. I turned on the Jeep (-12) in my driveway and got the following reports; from Dave 3FGK, nothing on map, nothing on P list. From Lloyd 3BZF he could see my grey Jeep over top of my GATE symbol and he had me correctly in his P list. (Dave is running 77c and Lloyd is running 77) Odd.

Then I noticed that I could see AA4QI-12 in Florida as a Jeep and wondered what the heck. I could see my string on line 24, all looked fine, so what de heck was the difference ? Answer, I send out a $GPGGA string, whilst AA4QI-12 was sending a GGA, an RMC (which by the way, Bob, was being parsed as "No> string"). Oh, isn't that interesting.

Look at P list and find that the mobile that I can see (AA2QI) is in there with a GLL. Scratched my head. So, when all else failed, looked at the newnotes ... Tah Dah ! Bob no longer defaults to parsing a GGL sentence; you want to see me (or yourself, Ron) try <ALT>S GPS MODES and select GGA. Poof ! I'm back on the map and in the P list; Dave 3FGK confirms this.

Which leaves me with a couple of questions; why the change in the default ? (or Why not parse both GGA or RMC as it did in the past ?) Secondly, anyone any idea of how to make the stand alone Tiny Two change which sentence it gives out from the built in Trimble GPS to RMC or whatever the default is ? (I'm not sure that I really want to give out my RMC, you see I have this nice big V-8 in my Jeep and there is a station with the call of VA3OPP running APRS ! hi hi) Bob, wonder if they can use APRS to automate the sending of speeding tickets ?

Ron, I've mis-placed you e-mail address; could you fire that one off to me again, please. Bob, any thoughts on going back to parsing both sentences; if not which stentence should be "standard" ?

vy 73 to all, de John VE3NEC (john.langtry@resonet.com).

Well my copy must be a special one HI. I-M-S just changes the beacon text
(right)

I-M-P changes my Lat/Lon (Right)

O-D stores often used digi path's (Right)

Now where did the command go to make a quick temporary digi change when
needed.?

Ok Ok, don't say it Hi. I found the command i was looking for, strange
it's been there right along ;-). This is what i'm talking about though
doesn't anybody have a list of APRS commands? (Not even the Author?) that
a person can print out as a reference. The command I was looking for of
course was the U = Digi path. I personally would like to see a file
available with ALL the updated APRS commands and of course what they do.
I had at one time started to convert all the F1-F files to help with this
but gave up when they changed so often, but if I had those I would still
do that, then all you would have to do is enter that command name and up
pops the explination for that command.

0x0D is the 'C' way of writing hexadecimal. Sorry for the confusion.
As for the LF, I use it but perhaps it is unnecessary. I took this
from the GPS-20 manual and have used it successfully.

JOHN.LANGTRY@resonet.com[SMTP:JOHN.LANGTRY@resonet.com] asked:

Secondly, anyone any idea of how to make the stand alone
Tiny Two change which sentence it gives out from the built in
Trimble GPS to RMC or whatever the default is ?

Answer: The Parameter put into GPSTEXT is what is parsed for and put into
the LTEXT (or BTEXT on real old models). GPSTEXT defaults to $GPGGA. If
you put $GPVTG you will get that string. If you put $GP (thats all) you
will get both strings.

Those are the only two strings the Trimble SVee6 puts out in standard form.
We are making arrangements to change the strings produced to include $GPRMC
and perhaps others. I will make an announcement on the SIG when that is
accomplished.

Richard, be sure that the Garmin is set to NONE/NEMA in the I/O settings.
Have the TNC in Terminal mode and you should be OK. Be sure that you have
locked on to the necessary number of Sats before you start moving.

I have the same basic setup and will be happy to help you, directly, if you
need more help. Good luck, hope to see you on the map!

Sounds like VE3NEC figured it out.  My intent was to make it so that you
could select which sentence, GGA or GLL or RMC that your GPS used.  This
would avoid some HSP timeouts when APRS just used whatever it got first
(if it wasnt a RMC...).

But (ARGH) I forgot that this same routine also parses on-the-air packets
too, so your selection will also apply to what you hear!  Looks like I
gotta fix that...  Can you select them all?  Ill have to check...

I suspect my WX station was not there because it broadcasts on HF, and VHF for a RELAY and 2 WIDES from Connecticut.

My question to the SIG (hier and lower archy): does it make any sense to put a GATE on the HF side to put it out on VHF networks all over the place, say once an hour? Or would this be of insufficient interest to warrant the bandwidth?

The G75 antenna has a preamp in it which helps out a bit.

I just ordered the Trimble GPS antenna from Paccom, but they are they are out of stock at the moment. So, while I wait, I figured I'd build the GPSPatch antenna.
With some scrap aluminum, hotglue and a tape measure, I whipped up an antenna without much attention to precision. I figured I'd have to add some amplification to get it to really work, but after 30 minutes building it, I took it outside and turned on my Garmin 90. I had lock on 4 satellites almost immediately with stronger signals than the antenna that comes with it! It does favor the higher satellites over the lower ones but I was impressed. Don't let the precision of measurements deture you from trying to build your your own antenna. I was so impressed I built a second one with nylon screws and spacers.

Well Jay i sure would rather see some WX stations then what i'm seeing
tonight again form HF. Nothing but keyboarding from VHF<->HF i just don't
understand why an HF station would want to have their message plastered
all over both bands at the same time, and then have the nerve to tell a
VHF user not to dare do the same, go figure.

```
hello all,

        a friend of mine recently picked up a Paccomm Tiny-2 with the
Trimble GPS board installed inside. (this is a brand new perfectly working
unit!).  What we would like to do is to install the Trimble gps board inside
a  Kantronics KPC-3.  (believe it or not it almost fits!)  maybe a
modification to the case or i could have my sheet metal friend make a new
case for the kpc-3 and it would be a perfect fit.   our problem is this....
the trimble works perfect with the tiny-2 but we cannot get it to work with
the kpc-3,,,,,, anyone have any idea why?  we KNOW, we have the all the
connections correct.. but just cannot get it to work.....when we put the
board back into the Tiny-2 it works fine...
also....we have the garmin software installed on a laptop...it reads data
from the garmin like there was no tomorrow.... but when we hook up the
trimble board it reads garbage....  any help out there??
```

I had several occurances of this over the weekend.  As I recall, line 25
should the recieved packet starting with GGA.  The strings did have the
Lon/Lat in them, but when you check the Posit list, it just showed 0s.

DFjr Good or Bad? I wish I knew!

I have had my DFjr on order since June24th and have not received it yet. I tried calling the 1-800 number with no answer today 10-14-96. I then tried their long distance number and still got no answer. I had the same experiance back on 9-30-96.

Has anybody received a DFjr? How long did you have to wait? Did Agrelo call you and tell you that it would take longer or did you call them or what?

Also, does anybody know if Agrelo might have gone out of business or just changed their phone number? I have the credit card reversal forms filled out and ready to send in, but I don't want to go that route without knowing first what is going on. If they have been backlogged for four months, I hate to cancel the order and go back down to the bottom of the list.

Is this message off topic? Probably. However the motivation isn't. I want to be able to demonstrate ARPS's ability for DFing to all of the other people that are investing heavily in an APRS statewide network in Oklahoma on 145.79. I believe that if I can get the DF unit so that I can demo it with APRS, many people will want to invest in it now, before the spring wx season hits. If everyone is already equipped by spring, it will be a cinch to get them to use APRS for wx.

Thanks in advance,

Scott

I ordered on June 13 and just got my unit. We have 4 that I know of in Dallas,TX.

Joe e-mails on this sig all the time and is very good about replying to e-mail.

Does this look like something you have seen before on the sig:

```
XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
            Agrelo Engineering
           Joe Agrelo/President
    P.O.Box 231 Pattersonville, NY 12137 USA
              ph (518)864-7551 effective 8/15
             fax (518)864-7553  "       "
        mailto:Jagrelo@cris.com
  WEB: http://home.navisoft.com/agrelo/ae.htm
Designer & Manufacturer of intelligent microprocessor
     based Doppler, talking products and RF.
   Experts in Microchip & Motorola processors
XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
```

It was worth the wait and I am have fun with my unit.

Joe has explained he was flooded with orders and to expect some delay.

I think it is great that several of the Ham vendors monitor this sig.

Hi,
I am sending this message for a friend, Ken W9ZMR, as you may have known,
his last trip was not heard (from Chicago to Dallas to Phoenix, to LA to
seattle and back through MN and to Chicago),  well some adjustments have
been made and he is leaving in the morning for NJ and then NC from Chicago,
a week long trip.  I expect him to hit some gates on the coast cause I see
gates out in NJ, but I would like to have any reports if you see him, he is
running 15 watts VHF 2 seperate paths one going through and out a gate.
Thanks, replies if you see him can be sent to him at kenpiletic@aol.com,
or to me and I will forward.
Ron

Yes Scott i have had mine for a while now and waited 6 weeks almost to the
day. Joe Agrelo always says that soon they will be off the shelf in stock
items, but then again he has said that many times Hi. I would send Joe a
message about your order, he may have lost it. It shouldn't take that long
but then again he maybe taking care fo those that paid in advance. Here is
Joe's address. Mine altough having some things i would like to see changed
works good and have had few problems.

The DFjr is worth the wait! I was one of the first to order, and it took
8 weeks to the day to get in. Yes, I thought it would never arrive, but
finally it did! Brother, I can tell you , I've had more fun with it, as
you will, in our local foxhunts here in the hills of north central Arkansas.
```

One thing that I have to comment on, is the support that Joe has given. He worked with me (and others) on a daily basis, helping me fine tune and eventually identify a problem. I later became a "beta tester" for a new uP chip for the DFjr. But anyway, they have made changes and improvements and supplied them to the owners free of charge! Like a new uP chip upgrade and a redesigned antenna array.

So, wait? You bet!

Message-ID: <1.5.4.16.19961015082621.1fcf8c32@apex2000.net>
Rendered body type: text/plain

Yes, the rainfall amounts were fixed in AutoWx sometime back. I rember the problem only in the Ultimeter II version. (Rain defaulted to 999 if there was an error - now the default is 000 if there is an error.)

I downloaded AW2k42D.ZIP this morning and it works fine - maybe a line or IP problem when you tried? AutoWx 2K is for the Ultimeter 500 and 2000 models and uses the Ultimeter Complete Record Mode. Version 2K 4.2d uses the newer beacon format of APRS 77. AutoWx (with awii in the filename) is for the Ultimeter II and the current version (AWii8xx.ZIP) can also be found in the TAPR software libarary.

Version 2K42d is the current release - 2k44 is being tested now in a couple of wx networks.

Thanks,

Les/N5KOA

First thing is that Monday was a holiday for some folks and that may have included Agrelo. I talked to a friend yesterday who had talked to Joe either last Thursday or Friday. Joe told Mark that his DFjr. was being shipped that day. They apperently had a bit of a problem with some circuit boards (I think) and that caused them to get a bit behind in filling orders. When you get behind like that you get caught in the delema of continuing to work to fill the orders or taking time out (and further delay the process) to call everybody and explain why there is a delay. I have heard good things about the DFjr. and look forward to the day that it reaches the top of the priority list and I can order one too.

Bruce, KQ4TV

Hi Mark,

A while ago you asked for suggestions to enhance the Mac & WinAPRS versions and I suggested adding parsing for the National Weather Service's RCM (Radar Coded Message). I don't remember if you said that you needed the program and/or data files, but I can send you a copy of the program if you still need it. Let me know.

Thanks

> control operator.

Actually, I think these would be covered as stations in automatic operation. But you're right...A non-ham may not initiate a transmission with out a control operator being present. I think a simple "Keep your mitts off." would suffice in most situations.

Yes Don, putting a DC block on the MAR-6 input is a good idea if for no other reason than to isolate the bias supply to the IC. However, it is not disaster if a short occurs as would be the case if the Garmin 20 five volt supply were to be shorted to ground. Cliff K7RR

Hi all,

With all the discussion about the DFjr it looks like people need
to know what is going on.

We are here Monday-Friday 9-5 (eastern), we were closed yesterday
for the holiday. The best place to get questions answered is through
direct email to me at mailto:jagrelo@cris.com
If it has appeared that we are not here maybe something is wrong
with the phone line, and it needs to be checked, we are getting
calls today however. There is no one to answer the phone during
our lunch hour and during the occasional morning meetings.

I havn't been very active on the SIG because I'm trying to get everyones
orders filled, which is the number one priority right now.

All the problems with the DFjr pc boards have been solved, any
open orders fron June and July are *all* shipping this week.

We have had more than our share of problems with the DFjr, but
most of it was due to poor employee workmanship during the assembly.
We have installed a fully automated pick-n-place surface mount assembly
line to help catch us up, that had a BIG learing curve. I am personaly
testing every DFjr myself, I now know that if you want something done
right, do it yourself.

When I do the test, I actally connect the DFjr to the MPA with a
Garmin-45 and watch all the data in a terminal program, I also
manualy spin the antenna array to make sure it is tracking properly
and that there is good tone, I put a scope on each antenna
to make sure the waves look good, and last, I scroll through some menus
to make sure the processor is doing it's thing.

I hope this helps.

Thanks for everyones patients and support.

OR... (if you're actually using a PC in each vehicle...) you can use
the ALT-S, (O)ther, (L)ock to prevent "unauthorized transmissions".
Comes in handy where threats to life and limb are insufficient. ;^)

> bandwidth?

APRSdos REPLY/COMMENT: In my opinion, that is good practice. But this assumes that you are the only such station in say 100 miles doing this on HF. What we dont need are three local VHF WX stations in XYZ City all reporting the same WX to us 1000 miles away. In fact, because of the 14 additional characters added just to get a VHF packet digipeated onto HF, I really dont like to see VHF WX stations going via GATES to HF at all. But since your station is already transmitting directly onto HF, that packet is much shorter. You may even go via GATE,WIDE in my opinion...

At lunch today I had a sudden urge to run APRS on one computer while another was running AutoWx using a single tnc. A quick glance at the Slave stuff in

```
the OPS.TXT file seemed encouraging but I had no luck.  Rather than wiring
up RXD, TXD and GND as per the docs, only the RXD and GND were Y'd to the
second computer but I got no packets.  (Packets were seen on both computers
when I ran AutoWx on both computers but APRS saw no packets.)

Has anyone else played with this feature?  If so, did you have to jumper any
other pins on the slave computer end?  If I don't xmit from APRS, why
wouldn't the 2-pin cabling work?

Rendered body type: text/plain

```
Hi all,
```

The Texas Instruments Amateur Radio Club, callsign K5DM, will be in charge of communications for the 1997 Winston Solar Challenge. This will be held July 23rd through July 27th, 1997 from Dallas TX to Austin TX. Right now, 22 teams are entered, but we expect some dropouts. The race will last 3 days; each evening all teams will gather at the days' end checkpoint. That way we won't get the teams spread out to much. Each team will travel 80 to 120 miles day. Top speed of some cars is expected to be 50 to 60 mph (downhill, noon, tailwind :-)).

This has got APRS written all over it. But, we have several problems to solve. The distances will be too great for 2m. There are few 2m repeaters over the race course. We'd also like to update a HQ in Dallas with race snapshots; maybe via HF gateway. Also, if we have 22 teams, how do we get 22 standalone trackers? Donations? As you can see, lots of questions.

Anyway, you can see this is an exciting opportunity for APRS.

I know other clubs have run similar events and I don't want to reinvent the wheel. I would appreciate any and all comments.

If you want to be involved, drop me a line. If you have any ideas or comments, post to the list or send to me. I'll keep the aprssig updated on our progress; and any major unsolvable problems :-)

371. TAPR Beta-Test of MIC-E APRS Units

From: Greg Jones <wd5ivd@tapr.org>
Date: Tue, 15 Oct 1996 20:15:32 -0500 (CDT)
To: tapr-bb@tapr.org (TAPR-BB mailing), aprssig@tapr.org (APRS SIG)
Cc: aprs-fl@tapr.org
Message-ID: <199610160115.UAA22333@tapr.org>
Rendered body type: text/plain

TAPR to begin Beta-test of APRS MIC-E (Mic encoder) units

TAPR is selecting a small group of people to beta-test (or beta-use) the upcoming MIC-E APRS adapter. The MIC-E (Mic Encoder) installs between your radio mic and radio and allows your GPS unit to transmit APRS AX.25 frames at designated intervals without needing a TNC! Very useful in many settings. You can listen to a discussion of the MIC-E by Bob Bruninga, WB4APR on http://www.tapr.org/tapr/html/virtual.html

The units are a semi-kit. This means that the board has already been assembled, but interface wires, box, and other items will still need to be configured and assembled for proper use. A Garmin GPS-20 can be installed installed directly on top of the board, inside the enclosure.

The purpose of beta-testing is to help generate and correct the kit documentation, ensure hardware problems are nonexistent in more variations not possible during the alpha-test, and that the software is functioning adequately in a wider range of applications. In addition, these beta-testers will become the core expert group to help others when the units are made available to everyone. Beta-testers will be responsible for communicating during the beta-testing using an Internet e-mail list. Regular access to Internet e-mail is required.

Beta-test units will be made available to those selected at break-even cost.

If you would like to participate in the APRS MIC-E Beta-Test, you will need to check

http://www.tapr.org/tapr/html/mic-e.question.html

and fill out the questions in as much depth as possible. Since there will be a limited number of Beta units available, this information will be used to select the best possible group for testing the units.

```
Just spent the weekend travelling from Lynchburg, VA  to Wilmington, NC
via Danville, Hillsboro, I-40 around Raleigh, Benson, and south to
Wilmington.  No activity in NC on the trip down, but there was ONE
packet burst on 145.79 on the way back about 25 miles south of Benson on
I-40 out in the middle of almost nowhere.  (Benson is the intersection of
I-40 and I-95).

Previous trips have had less results, to the point it is a waste of time
putting all the gear in the car, but I do listen to 145.79 and set the
squelch  loose.  Nothing is heard except for the squeel of brakes when a
passing radar detector gets into the beam of my gunplexer.

Wonder if this "brake" response counts as a two way communications?  The
signal was sent, and there was a reply.

If it is digital communications,  it would be classified as real
sloooooow baud.

Yes, I understood that the stock antenna does have a preamp in it, but I
understood that it is located in the antenna itself, which is why they
provide the 5 volts at the BNC.  This is more reason to be amazed at the
little homemade dipole working so well.  It was running without the
benefit of the preamp, being connected directly to the BNC with a hunk of
low-loss coax.

The Garmin runs a 'Garmin - Garmin' mode, which is not the normal NMEA
0183 (4800 baud) mode.  You may be aware of this, but just a reminder.
The fact that the Garmin does transmit data on the wire is good, it may
not be set to the proper prorocal.

We (TRPS) added a local 1200b user port to the node at Moody last spring,
it became operational shortly before HamCom.  It is somewhat obscure, and
sees little use, but has some kind of range, being located several
hundred feet up.  When I range-checked it on the way to HamCom this last
summer, I started hearing it at Round Rock, and lost it somewhere
around Waxahachie.  It works as both a digipeater and TexNet node.
We even have a little bit of telemetry on it.  (That range check was by
audiable copy only, not working packet on I35, roughly MP 250 to MP 380).

While I have some plans (previously discussed on this SIG) to add some
code to TexNet to handle unconnected APRS traffic over the network,
it remains a concept only at this time, and I am hampered by lack of
codespace to do very much.  In connected mode it would certainly
get back to Dallas over the network, assuming the network is intact
at the time it is needed.

That unit is on 440.100, and is being run on a duplexer with the 445.100
trunk.  Maybe not an APRS freq, but a usuable digi.  Of course, next
summer is a long ways off, when it comes to predicting equipment being
operational, particularly that site, which is hard to get to since all
electronics is up there at the antenna, on a TV TX tower.  Likewise for
trying to update the EPROM in that remote node.

There is also a 2M repeater located on that tower, even higher, on
145.15, and is operated by the folks in Waco.  It also has pretty
good range.  Right now it is giving some apparent trouble though.
As I recall, there is some provision on that system for a link back into
Ft Worth for SKYWARN use.
```

You might want to keep both these systems in mind.

Date: Wed, 16 Oct 96 06:50:55 -0400
To: <aprssig@tapr.org>
Message-ID: <199610161046.GAA27827@bridge.net>
Rendered body type: text/plain

I need help from all those who have used javAPRS. There seems to be a strange bug where some stations are lost by different versions of Netscape/OS combinations.

Please look at:

http://www.peel.com/test.html

After the stations display, hit 'L', then open the java console. If possible copy the text from the station list (between the ******* lines), or at least report to me how many stations are in the list.

Send reports with operating system version, browser type and version, and the station list to

sdimse@bridge.net

(Please don't waste the SIG bandwidth...reply directly to me. Thanks

73 de Steve

Trying to interface Ult 2000 to a Tiny 2 for standalone APRS operation.
2000 is not standard rs232 I assume as no data gets to Tiny 2. Anyone
got a fix ?

I looked in Oct mail archives but no mention of this problem.

Thx.

Hello...

Bloomington, Indiana will host the Hilly Hundred bike ride this weekend.
We will be trying out APRS at the event, equipping several of the SAG
vehicles with trackers.

If anyone on the SIG is participating in the ride, you can get more
information from me. For anyone bringing their GPS, we will be operating
on 145.79, with portable digis, alias RELAY. Bloomington WIDE digi is
WD9EVK-1.

Voice frequency is 146.64, and hams participating in the ride are
encouraged to check in at the communications center at Hilly HQ.

So what exactly was he sending??? S L O W D O W N ???

Re VHF or HF in mobile: Been there, done that, with VHF only. Had

minimal contacts from AZ to TX and back, AZ to MT and WA, but collected
great HSTs which I used to error-correct the existing maps, and build new
maps. Had at least one contact each trip, so to me it was worth the
while. Drove around San Diego and had 2-3 pages of VHF stuff (that was
awhile ago, probably more now). Drove through Salt Lake City and had 2-3
contacts, one, Doug/KC7CO, now a resident of Seattle and good friend.
I've made alot of new friends from this hobby, and especially while
mobile APRS on VHF.

385. 7.7C fails

From: w4wwq@juno.com
Date: Thu, 17 Oct 1996 08:27:33 PST
To: aprssig@tapr.org
Message-ID: <19961017.082740.9759.0.W4WWQ@juno.com>
Rendered body type: text/plain

After getting back to live APRS I find that I am getting a lot of failures of APRS. The screen locks up. It was suggested that the earlier version I was running didn't deal well with this type of problem, and I should try the latest. So, now running 7.7C, there is still a lock up problem. It appears as a bright red band, about 8 lines high, horizontal across the middle of the screen covering the map underneath. Within the red band, in normal text size, the following usually appears every time I check the screen after being unattended for hours:

```
LM,PM: 77        1
A$:KE4JJU-3>APRS,WIDE*:*F007200000000
C$:
ES$finished Parsepaklz 3371z 3.725352E-41
OOOPS!  ERR number 6  Hit ENTER to resume or Q to Quit?
```

Only if the ENTER key is the next action will it resume and then a space bar is needed to redraw the map. Any other key will dump it back to DOS.

I have seen a similar error, but number 5, on the screen in the last 10 days but the rest of the text appeared similar in format and call sign.

Rumors is that there is a negative number being sent from a wx station. Is it from the call that ends up on the screen (in this case KE4JJU-3) or is it an unknown station going thru KE4JJU-3?

Is anyone else having this problem or have ideas to avoid it?

I use a 286 12MHz with math co-processor and MFJ 1270 TNC if it matters.

I think you need a null modem cable for it to work as both devices are dte units. Also make shure that your tnx is set to 2400 baud for the RS 232 and that the String is set to look for !! string from the U2000

Hope this info helps

388. javAPRS and Netscape Bug!

From: Steve Dimse <sdimse@bridge.net>
Date: Thu, 17 Oct 96 08:14:57 -0400
To: <aprssig@tapr.org>
Message-ID: <199610171210.IAA14895@bridge.net>
Rendered body type: text/plain

The problem with javAPRS seems to be limited to Windows95 and Netscape 3.0, although I have no reports from W95 and Internet Explorer users. In investigating this it seem that other applets have had problems running under Netscape's Just In Time (JIT) compiler, presently only included in the Windows version of 3.0. It seems that the problem is in the exception handling code, that fails to properly call the "catch" routine if an exception occurs. This error handling code is central to the working of Java (and javAPRS). I will be trying to come up with a work-around, but until then, be aware that W95/Netscape3.0 users are only seeing about 1/3 of the stations actually appearing.

But, it ain't MY fault!

Message-ID: <3265DCE7.6E8C@naples.net>
Rendered body type: text/plain

As of 2250z on 16 October, Collier County (FL) Eoc is beaconing WX data from a new Davis Bros. Monitor II. The system is online thanks to a day's hard work from KG5QD and WB3TIH while we on the staff were busy with Tropical Storm LILI. The system has temp, barometer and wind dir/speed and a self tipping rain guage (.01 inches) available. Humidity will be available as soon as our replacement sensor arrives (if the s/w will carry it...I really am not quite up to speed!).

When looking at our wind data, keep in mind that the anemometer is on top of an 8 story building, some 130 feet in the air...so readings will likely be somewhat higher than the surface.

```
Correct the Ultima 2000 is not a fully implemented RS-232.  In order to get the
unit to work as a standalone the TNC Must be intelligent and have the ability to
identify the input string.

On the KPC-3 the TNC has a GPS Mode and the Ultima 2000 uses the GPS
to send what would ordinarily be the GPS sentence. The String is prefixed
with two !!.

If the Tiny 2 Does not have a GPS mode capability so that it can
detect the input string of a GPS it will not work with the Ultima
2000 as a standalone.

The Old Tiny 2 that I had which I swapped for a KPC-3 was the reason
for the change in TNC's.

>
>Your parameters will greatly speed up my setup time.
>
>Thank you in advance.
>

Larry,
   Here is what I have set for my KPC3. First I restored the default
settings using the RESTORE D command from a terminal program. Then I issued
the INTFACE TERMINAL command.

MCOM OFF
MRESP OFF
HEADERLN OFF
MSTAMP OFF
CSTAMP OFF
PID OFF
MONITOR ON
These params are in the Mac APRS docs for the KPC3 and I have set them in
the Mac APRS TNC settings dialog box. In addition I set the two commands
below.
```

XFLOW OFF
Since I'm using hardware handshaking I set this to disable software handshaking. In the serial tool dialog box I have selected DTR & CTS for the handshaking.

CD SOFTWARE (CD = carrier detect)
I use this and no squelch on the radio because my radio doesn't squelch too well on the local frequency, I think somebody's consumer electronics in my appartment building is transmitting noise on this freq. It also insures that any packets that can be received are received.

I am in a second story appartment of wood frame construction with wood siding. Stucco has chicken wire in it and forms a rather good shield. I have a homemade 2 element quad antenna in my living room mounted on a spring loaded 2 x 2 pole from the floor to the ceiling. It is fed by a 1/4 wave shorted paralell conductor transmission line with a coax balun tapped on at the correct distance up from the shorted end to give a match. The driven element is a closed loop and is fed at the bottom by one of the conductors of the matching section. The other conductor is unconnected. This arrangement is identical to a J Pole antenna except that a full wave loop is used in place of the normal 1/2 wave dipole. It works perfectly and has the advantage that the feed is entirely below the loops. I invented this arrangement myself (he said proudly).

Regards John Lakeland kc6vlr

393. New Central Georgia Digipeater

From: kc4zgq@ix.netcom.com (JOHN F. KRAUS II)
Date: Wed, 16 Oct 1996 17:34:36 -0700
To: aprssig@tapr.org
Message-ID: <199610170034.RAA21661@dfw-ix7.ix.netcom.com>
Rendered body type: text/plain

Hello to all on the SIG. I thought I would send a short note to report that at long last Central Georgia has a true WIDE-RELAY digi. With the help of several local hams Tom Rogers KR4OL has placed a digi near the junction of 1-75 and 1-475 just north of Macon. The digi has a true HAAT of about 400 ft. The present antenna has 9db gain with omni coverage. It presently covers Central Georgia quite well. Future

plans are to replace the existing 400 ft of 75 ohm CATV hardline with true 50 ohm hardline which will enhance power out as well as receive considerably. The TNC used at this site is a KPC-4 which will be used as a gate to uhf 445.925 in the near future as the radio is already on hand we lack only coax and antenna. We would be very interested in any

reports of performance both from mobile stations passing through as well as APRS base stations. Please send any reports to me at the address below.

Thanks to all who offered help and advice.

Hello Group,

I have not been active for a while and just loaded latest ver of dos aprs. I do not seem to be seeing stations like in older ver of program. I am seeing some beacons es one liners between stations etc. and odd time can get list of stations and more odd times i get gateway station listed.. This is on 30 meters and signals real strong. Any hints?

Thanks.

The tiny 2 does have the gps feature...I have used it with the Ultimeter
II a few years back.  However my method of testing may be at fault, but it
does make sense to me.  I have placed the tnc in converse mode and have
the 2000 sending a stream using the data mode output selection.  I would
assume the tnc would xmit when the buffer fills or it sees <cr>.  I was
hoping to use this method so I could place the 2000 in packet mode and
have it xmit every 5 min rather than use the gps mode. I would like to
see the highest ws over the past 5 min. as reported by the packet mode.
I hope APRS supports that.

Hi.

I received several messages asking if I had or hadn't gotten a beta-test form. Here is the list of names I have received something from using the web form. I have received one or two just by e-mail, so they will not appear on this list (i.e. grep ^Name: mic-e.mail).

If your name is not on this list, please give the web page another try. Be sure to allow it to complete the submit or I will not receive a form to pass along to the beta test review committee.

All the requests so far are all very interesting...and should make for some interesting beta testing.

Cheers - Greg

Names as of 10/18/96:

```

Congratulations, guys.
When I eventually get home from California, I will expect to see that
thing banging the ears off of N4NEQ-2!

Consider leaving the CATV hardline.  Your SWR is only gonna be about
1.5:1 with it.
If you MUST have 50 ohm, there are simple transformer/connectors you can
make or buy.  Msg me if you want the info on how.

Again: good job.

i've had several trips past madison wisconsin, chicago, and st.
louis.  there are several 'hinterlands' in between, but those areas have
always filled my lists and brightened my map. since i'm usually alone i
can't answer messages, but have gotten some very nice ones. i mainly use the
screen information to avoid grabbing a paper map -- it's neat till s/a nails
me big time (one hunting trip spent an hour apparently 20 miles offshore
<g>). it would be nice to see more stations beaconing, but i'm sure that
will come -- each trip gets more position reports from home stations....

406. TAWG FALL APRS CONFERENCE 96

From: AA8JK@aol.com
Date: Fri, 18 Oct 1996 11:42:04 -0400
To: aprssig@tapr.org
Message-ID: <961018114204_1745271859@emout08.mail.aol.com>
Rendered body type: text/plain

SECOND ANNOUNCEMENT

TAWG FALL APRS CONFERENCE 96
October 26, 1996
Columbus, Ohio

Bringing together a contingent of APRS technologists to discuss recent
progress within the Tri-state (Ohio, Indiana, & Kentucky) area and the
direction for the future.

Everyone with an interest in APRS is invited.

The Columbus, Ohio site was chosen to be a central location for attendance
for hams in Pennsylvania, West Virginia, Northern Ohio, and many of the TAWG
members.

Topics to be addressed include:
- Recent APRS network achievements as well as future challenges.
- Committees to promote APRS activities.
- APRS interface with the National Weather Service.
- Question & answer session for newcomers.
- Other activities to be announced.

SPECIAL EVENTS
- A GPS Video (Approximately 20 minutes).
- A demonstration and progress report on ERIC (Electronic Roadway Information Companion). ERIC monitors data from your GPS and through an internal synthesized voice guides you along the way. ERIC adds speech to your GPS. Innovation at work.

LOCATION:
Whetstone Branch
Columbus Metropolitan Library
3909 N. High Street
(Near the entrance to the Park of Roses.)
Columbus, Ohio
Destination Waypoint - 40-02.47N 083-01.19W

DATE/TIME   October 26, 1996 1030 - 1500 local

SCHEDULE:

1000-1030   Room opens, Set-up

1030-1100   Opening Remarks, Intros, and update on TAWG.
Sid, AH7E

1100-1130   APRS: What it is and how you can use it. Mike, KB8SSH

1130-1200   GPS Video Joe, W8RIK

1200-1300   APRS interface with the NWS & ARES-Open Discussion.
Moderated by Joe, W8RIK

1300-1400   Open Forum
Moderated by Sid, AH7E
The Future of TAWG
Structure of the Organization
Committees to Promote APRS

1400-1500   Demonstration and progress report on ERIC
(Electronic Routing Information Companion).
ERIC adds speach to your GPS.
Presented by Eric, N8FYD

Joe, W8RIK says we can adjourn to one of the many good "pizza" establishments
in the area after 1500 hours.

TALK-IN: 147.12+ Repeater
THIS IS A CHANGE FROM FIRST ANNOUNCEMENT

SPONSOR: Tri-State APRS Working Group (TAWG)

All are encouraged to attend. For further information contact:

Sid, AH7E
e-mail: AH7E@aol.com
Phone: 937.866.3911 (New Area Code)

Rendered body type: text/plain

Thanks for all the replys on my question. My portable system is a Magellan Trail Blazer XL, HP 95 palm PC, alinco HT, and Packomm Handi Packet. The system is much to heavy for a 2000 mile hike. Also the Handipacket is dead and to expensive to repair, a KPC is probally cheaper than repair and will run a long time on tiny 9v battery. The Handi battery was practically useless and failed me so many times I eventually always carried an external battery.

I wonder how much "juice the Pico tnc and GPS combo requires ?

It seems like the best system would be the MiM connected to DeAngelo transmitter and some tiny gps. The whole system would have to be very near 1 pound and would run on AA alkiline batterys that could be replaced weekly. Nicads are not practicle in the woods, no recharger and poor weight to life ratio. The system would only be turned on for a fix / xmit periodically during the day when in high open areas. GPS units work very poorly in deep woods. There would be no need for a display of any type on this stand alone system.

With the expenses of a six month backpacking trip and no income during this time it will not be practical for me to purchase / build such a unit. I do however invite your further input in this sort of project. Its fun to talk about anyway!

The GPS data I mentioned that covered the Appalacian Trail:

I did not get a chance to talk to the owner of this data, with over 800 hikers at the "Gathering" in Carlise PA and many other programs I never did get to meet this fellow. I will continue my search for him and inquire about the release of the mapping data.

Tahnk You Charles

Message-ID: <199610190303.XAA10638@mail-e2b.gnn.com>
Rendered body type: text/plain

Hi All,

As many of you know, I've been trying to extend APRS into the so-called "APRS Black Hole" to my north. To this end I donated an old discarded 286 to a friend well situated to become a WIDE-REALY for the lower Hudson Valley area.

Little did I know at the time that this antique had a Hercules video card and monitor. According to this fellow, and THE DOCS, APRS locks up at the first whiff of this video system.

After talking with my friend, he seemed to remember some little program that would "emulate" a CGA something-or-other (or something like that!) Is anybody on the SIG aware of a way around this problem, short of getting another machine? After all we've gone through getting this clunker operational and all the hype and demonstrations I've given on APRS, we'd hate to have to go back to the drawing board.

The station in question is situated where he might link up

```
the existing "northeast corridor" APRS net with that in Schen-
ectady and points north and west!  THIS is why I'm so hot to
get this guy up and running.  Such a link is the next logical
step in expanding APRS to cover as much area as possible and
create connectivity everywhere (oh, okay, I'm allowed a little
wishful thinking, aren't I?)  Thanks & 73

               Arte Booten <N2ZRC@gnn.com>
 (Packet Radio: N2ZRC@KB2VLX.#BRONX.NY.USA.NA)
  [Cruise Missile Coordinates: 40 52.69N / 073 54.06W]

... Sensors say there is nothing at those coordinates ...

Rendered body type: text/plain

```
Hi SIG. Will somebody literate w/both W95 and W3.1 please tell me how to
fix the following problem:

Tonite I downloaded the Powerpoint presentations in the aprs sig
presentation subdirectory. I unzipped the file and it created a sub
directory called "my docum" where the file is stored. I'm using W3.1, so
can't do anything with a directory that apparently was created with W95,
because it has a space between the MY and DOCUM. I can't rename the
directory, can't delete it, can't move it, etc. Nor can I open the file
thru PP because it doesn't recognize the space in the directory name.

Help please.

The program in question is called "simcga," and if I recall correctly, it will work with DOS APRS.

Heck, someone would probably give you an 8 bit VGA video card, and VGA monitors can be picked up for $35 or less. A buddy of mine GAVE AWAY a 9 inch paper-white VGA monitor! Without consulting me even! Sheesh! I woulda paid him something for it. And I have yet to find another one. I think it was from a POS terminal.

If you have Norton Utilities you can use DISKEDIT to change the name of the sub-directory to something DOS will let you command.

416. GPS 20 data question.

From: TCox17892@aol.com
Date: Sat, 19 Oct 1996 11:03:45 -0400
To: aprssig@tapr.org
Message-ID: <961019110342_129709204@emout10.mail.aol.com>
Rendered body type: text/plain

In the $GPGGA output from my GPS-20, the first nine fields look plausible.
 They are followed by ",M,-34.1,M,," an asterisk, and a checksum.

This looks like one too many fields, and I don't understand the "M"s. I am
not providing differential input, so expected a geoidal height, followed by a
couple of nulls.

Any idea what's going on?

 :  Were you really looking for the NMEA Checksum that is used by
 : Garmin GPS units on the data output ??
 :
 : ftp://sundae.triumf.ca/pub/peter/index.html
```

No, I was really looking for and as my followup indicated I found at
the .mil site the GPS parity algorithm. It has nothing at all to do
with NMEA.

Too bad Adobe's OS/2 acrobat reader generates upside down and
backwards images on a laserjet, but that gets beyond the pale of
aprssig...

But bringing it back into something relevant to aprssig the document
at the .mil site will have at least a few things of interest to anyone
with more than casual GPS involvement.

```

I had the same problem with the same file recently! I think you can use the
DOS command deltree to delete the directory, e.g. "deltree my*" (or
something like that). Next time don't use -d with pkunzip so it won't
create that subdirectory.

Rendered body type: text/plain

APRS is active at the Rueben H. Fleet Space Center in San Diego's Balboa
Park Museum district. Visited by thousands of tourists a year, the Science
Center has a fully operational Ham Station with a Kenwood TS450S for HF and
an APRS station with color monitor on 145.790 monitoring all the San Di ego
area action. This all thanks to Jack N6FUG who is the Projectionist for the
Center's IMAX theater. Aided by area Hams, the Ham station will be expanded
to feature SSTV, OSCAR Satellite and other Ham items, but APRS continues to
be the highlight of the exhibit. Visitors watch the mobiles drive around and
learn about how the GPS sats make it all possible. If you plan to visit
San Diego, be sure to stop by the Museum and see this station! They have
established a theme called "SIGNALS" and besides the Ham Station, have a
Morse Code pair of stations where visitors can communicate across the room
with this unusual (?) method.

I just got back from a trip to Florida and used a Garmin 45XL about
$300.00 and a Kantronics KPC3(cost around $115.00) which will run on a 9
volt battery and a 5 watt ICOM Handie Talkie. It worked fine. You might
try using a Mag Mount also.

Hope this helps.

I've been following this mailing list and monitoring the activity on 30
meters. Looks like lots of fun.

A couple questions:

Is there some summary document that describes the various ways that weather and other analog data can be acquired by a PC? I picked up a Radio Shack in-door/out-door electronic thermometer last week. It's neat to look up and see the digital reading of the outside temperature - but having it available in the computer would be even better. I realized there's got to be a better way after writing down the third temperature reading.

Has anybody set up an input to record current sunlight? Something relative like 0 for pitch dark to 100 for bright sun?

Tnx es 73,
Bill - WA7NWP

Rendered body type: text/plain

You can use Xtree to copy the file to a new directory, or even to delete the directory.

Xtree is a really useful program but is a DOS program and if you use a DOS program to copy a file with a long filename or directoryname then it will not be identical to it's Win95 file or directory. To properly copy files or directories you must use something like the Win95 Explorer.

It is basically an indicator of how well your gps is receiving the satellites. If you are receiving the satellites well, and you have enough satellites in view, then the dilution number will be low. Your GPS accuracy, or confidence level, is good.

John W. Wilson, KN4HX

Dilution of PRecision is really an indication of gemetry.  FOr example, I
work a lot in mines, where at the bottom of a deep open pit we might have 5
satellites in view, with good signal strength, but the apoerture (field of
view) is so constrained by the  geometry of the pit that the Dilution of
Precision is a high value and, as a result, the accuracy of the "fix" is low.

Cheers,

Lyle

Dilution of Precision is a multiplier. It says that if the fundamental
accuracy of GPS is X on the individual satellites, then the resulting
navigation parameter is poorer by a factor of xDOP due to thew  geometry
of the satellites the receiver is currentkly using. There are several
DOPs in common use: GDOP, PDOP, HOPDOP, VDOP, TDOP. The "G"=General, P=
Position, H=Horizontal, V=Vertical & T=Time. PDOP = sqrt(HDOP^2+VDOP^2)
relates the overall positional accuracy to the Horizontal and Vertical
measurements. GDOP includes contributions from H,V & T. The mathematical
definition relates to the value of the diagonal elements of the cobvariance
matrix used to convert timeing measurements on the satelliuttes into
position determinations.

Hooking up a photo cell like that will be pretty easy once the analog
input
ports are available.   I was curious if anybody was already doing that.

My assumption is, that with APRS, certain broadcast data values such as
```

temperature are pre-defined but there are other misc fields available.
Is
this true?

The really big quest is: what hardware options are there to add this
data
gathering capability to my system???

73,
Bill - WA7NWP

Bill; I don't know that much in ref. to aprs myself...I do know that the
ultimeter II has an interface that go into the pc and then all info should
go to the aprs program....also kyou can connect a gps to some tncs for use
with aprs.....   Hope this helps....73 de Bill>

437. Re: [APRSSIG:5704] Re: Gathering Wx data

From: Bob Derderian <n2iph@cyberenet.net>
Date: Sun, 20 Oct 1996 15:49:13 -0400
To: aprssig@tapr.org
Message-ID: <326A8239.112F@cyberenet.net>
Rendered body type: text/plain

There are a host of options available for data acquisition with desktop PCs, though none will interface with APRS that I know of.

It may be possible for SOME of these devices to be connected to a TNC much in the same way that a GPS can be at the serial level, provided that the device has a serial port (some are on ISA or VL-bus type PC cards).

The Kantronics KTU I believe can be interfaced with a variety of devices.

You might want to check out come of the following websites:

www.omega.com
www.natinst.com
www.isa.org (links and info on many related sites)

there are many others, try a search on 'data acquisition' at YaHoo or Alta-Vista.

Hope this helps,
Bob

Rendered body type: text/plain

Replace the "space" in file name with a "?" and you will be able to rename the file from DOS.   Intersetingly, GWBASIC will handle the blank in a file name but, you will have to conslult the manual for the BASIC equvalents of "delete" and "rename" i.e. "kill" and "name"

Rendered body type: text/plain

Hi Don. I am most pleased that you had sucess getting the "simple patch" going. I really enjoy seeing complicated things reduced to simplicity.

Yes, hot glue seems a good insulator. Time will tell. As for the BNC connector, in a later model I placed a chassis mount below the ground plane and found it just right as a foot for the other Nylon feet.

I just returned from PACIFICON where there were many pontificating about patch antennas an not a soul that had any technical depth, so I continue to suggest you fabricate to 3% tolerance until we know otherwise. Is there anyone on the SIG that knows the design equations for a patch antenna? Might be useful to know! Cliff Buttschardt K7RR

On 17 Oct 1996, Donald Rotolo wrote:

The Kansas City APRS Working Group sponsors an APRS net on 145.43 (-600) locally every Sunday evening beginning at around 2030 CDT/CST. The net convenes immediately following the KC ATV Net. Check-ins are taken by both voice and APRS.

We want to invite ALL APRS users nation-wide to participate via HF APRS. To check in, send a message to KU0G-1. We are monitoring both HF (10.151 MHz) and VHF (145.79 MHz). Your ACK will confirm your QNI. I will post a message to the SIG right after the net to list all check-ins received!

Rendered body type: text/plain

Hi all,
Well I still hope that the APRS software authors provide support for at least 1 serial a to d board. Recent mail on the sig about cadmiun sulfide cells and the like demonstrate the variety of uses it would serve. For those currently discussing the subject it was discussed in some depth a while ago here, read back.

448. DFjr to Garmin-20 GPS Interface

From: kc5ejk@onramp.net (Robert Winingham)
Date: Mon, 21 Oct 1996 03:30:54 -0600
To: aprssig@tapr.org
Message-ID: <v02140b02ae90eea3405c@[199.1.11.101]>
Rendered body type: text/plain

I have my DFjr and plan to use it with a Garmin-20.

Are there any DFjr users that have attached a Garmin-20 GPS ?
I also wonder what baud rate you found works best.?

I also am wondering what we should ask the MACaprs and WINaprs software to do with the bearing data from the DFjr and the GPS course data $RMC so that we have absolute bearing displayed and not just relative bearing,
OR
should we just have the selections Bob does in DOSaprs.

There is mentioned of a Fluxgate in the APRS doc file but the last time I used a Fluxgate it was a three-axis device towed 3 miles+ deep in the ocean. I think I will stick with GPS data.

```
AMATEUR RADIO LO-JACK

   And finally, most people are familiar with the Lo-Jack system for
recovering stolen vehicles. Amateur radio operators have been
experimenting
with a similar system called APRS which really isn't designed to recover
stolen cars, but certainly could be used in that mode.
```

Now, the San Diego California Responder newsletter reports that
recently, as Scotty Leikett, W8KXX, was going to bed, he looked out his
window and noticed that his APRS-equipped car was missing. One glance
at
his computer terminal showed that the vehicle was across town and
moving!
He notified the San Diego Police Department, but the dispatcher would
not
believe that an owner had the ability to track his stolen car by radio.

When the policeman arrived, Scotty explained the ARPS system and
showed
him the car's symbol with the unique amateur call on an APRS city map.
The
officer relayed the precise location to the police cruisers.

As it happened, the stolen car and a police cruiser were stopped at
the
same red light with the thieves were still in the car.   Surprised at
the
officers' sudden attention, the culprits made an illegal left turn and
the
chase was on. Soon after the crooks abandoned the car and escaped,
leaving
a hand gun behind.

The car was recovered without major damage thanks to ARPS and ham
radio.

455. APRS77d replaces 77c!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 21 Oct 1996 16:27:06 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.961021162033.28532A-100000@arctic>
Rendered body type: text/plain

```
Files just uploaded to TAPR:
   APRS77d.zip  about 1 Meg
   77to77d.zip        445k
   76to77d.zip        750k.

77d fixes the major bug found in 77c.  Once 77d proves good, then all
copies of 77c should be deleted everywhere...

Here's the scoop:

Ver 77d:  Big problem in 77c.  It defaults to not recognize on the air
  GGA position reports.  You had to do a alt-S-G-M-G to turn on GGA and
  then it would ignore RMC!  This was intended in 77c to allow the user
  to select which NMEA string *HIS* GPS would use, but it also filtered
  out on-air packets too!  Now you can select GGA, or RMC, or BOTH
  (Default)
* This required a new CFIG file.  YOu can add a 0,0 at the end, just
  before  the listing of your DIGI paths (or ****'s if you dont have any),
  and rename  your existing CFIG75b.APR to CFIG77d.APR if you like...
* Changed default path to RELAY,WIDE and added default OPS-DIGI paths
  of NONE, RELAY,WIDE and WIDE,WIDE.
* Magnified default altitude scale in 3D by factor of 4 for CAP.  Now
  32 mile scale will default to 8000 feet.
* Moved OPS-UNPROTO command to OPS-DIGI-ENTER command for consistency.
  But so you can still do it with 2 keys, OPS-ENTER will work...
* Fixed a bug in 77c that allowed remote WX BText to cancel out the WX
  data

Ver 77c:  Changed alt-BText command to INPUT-MY-STATUS to more correctly
describe the APRS STATUS Beacon.  Also eliminates the confusion between
TNC BText and APRS Status Beacon.
* Re-arranged INPUT-MY commands to accomodate MY-POS and MY-STATUS
* Moved MAPS-BORDERS to MAPS-PLOTS-BORDERS
* alt-S-DF-MAGvar is now listed in the alt-S-DF menu
* DF bearing line length now proportional to sending station map range
* Changed CONTROLS-K/M to CONTROLS-METRIC which is now same as WX-METRIC
* Course and SPeed box now displays KPH if Metric
* Removed special GGA display on 23rd line.
* Now alt-S-GPS-MODES-GGA forces APRS to use only the GGA (or GLL)
* Added alt-S-GPS-MODES-RMC to force APRS to use RMC only (default)
* SEND (copy message) now lets you add text to the end of a copied msg.
* Msg replies to Queries will use line number {: and will not be acked.
* New parser eliminates all packets that dont start with $,% or A-Z, 0-9
* Fixed Z/z case bug in Manual POS corrections that messed up ZULU time
* REMOVED MK100k3.EXE from standard distro.  Get it from tapr or BBS.
* Edited and cleaned up GPS.txt and renamed VOX-APRS.txt to MIC-E.txt

Ver 77b:  77a had a bug that caused incorrect selection of the default
response during a prompt.  It was fixed and immediately re-relesed as 77b.
* New definitions of first POSIT character: (pending Sproul's agreement)
  / = TNC only     M = MacAPRS     X = Xaprs
  @ = APRSdos      W = WinAPRS     J = javAPRS
* JUST-TYPES command will display station TYPE (above) instead of symbol.
* Fixed WX fade-to-gray
* Fixed mouse to sleep problem
* Fixed ALT-BTEXT being forced to UCASE
```

457. Central Georgia Digi

From: kr4ol@juno.com
Date: Mon, 21 Oct 1996 14:43:06 PST
To: aprssig@tapr.org
Message-ID: <19961021.144442.29767.1.KR4OL@juno.com>
Rendered body type: text/plain

```
On  Fri, 18 Oct 1996 05:08:09 EDT, Ralph Fowler, N4NEQ Wrote regarding
the new Central Georgia Wide/Relay Digi and the trouble with the 75 Ohm
CATV hardline;

>Consider leaving the CATV hardline.  Your SWR is only gonna be about
>1.5:1 with it.
>If you MUST have 50 ohm, there are simple transformer/connectors you can
>make or buy.  Msg me if you want the info on how.

        Greetings Ralph, and the SIG! Thanks for writing regarding the
new Central Georgia Wide/Relay Digi. We are very excited about getting
it up & running. This has been an amazing project that has been built
with some new ideas that may prove to be beneficial for others that want
to put up Wide area digis. I want to speak to Ralph's suggestion that we
leave the CATV hardline in place, but first let me give you some
background on what we have done.

        KR4OL-2 is located on a commercial tower North of Macon at the
365' level. This gives us an approximate HAAT of 400'. The antenna and
feedline were installed on the tower last February and have been serving
a packet node and BBS ( MCN07 and MCNBBS ). At the time, no 50 Ohm
hardline was available within our budject ( $ -0.00 ), so we opted for
using the 75 Ohm CATV hardline. I purchased the Z-D Manuf. transformers
that claimed to make the 75 Ohm Cable behave and look like 50 Ohm cable
to the radio. After it was installed, the SWR at the rig was over 3:1.
After much consideration and studying, it was decided the second hand
Station Master antenna must be at fault for the high SWR. Another climb
was made & the Station Master changed out for a Diamond F-23a that was
proven to be flat at the frequency we desired. After installation, same
result. SWR was above 3:1. I finally installed a UHF "tee" between the
rig and the CATV transformers to make a tuning stub. With this, I have
been able to get the SWR down to 1.1:1, and performance has improved.
Since then, we have installed a second port for the node and BBS on the
tower at 280'. Some 7/8" 50 Ohm hardline was donated and installed. On
this port, we are operating at less than half the power we are using for
the higher antenna with MUCH better performance. After consulting some of
the local repeater owners, some of which have experimented with CATV
hardline, we have determined that the transformers will probably work
great with 75 Ohm runs of 100' or less, but the 400' we have in the line
is just too much for the transformers. We are presently awaiting delivery
of 50 Ohm 7/8' hardline to replace the CATV hardline. We anticipate to
see this feedline and antenna begin to outperform its sister antenna
located 80' below it.

        In another message, I will explain how one transmitter, one
feedline, and one antenna is serving not only APRS on 145.790 Mhz., but
also MCN07 and MCNBBS on 145.070 Mhz. simultaneously. This is exciting
stuff!

                                73! de Tom, KR4OL @ KR4OL.#MCN.GA.USA.NA
                                                or, KR4OL@Juno.com

I've personally used 75 ohm catv hardline with no transformers
in both VHF and UHF 50 ohm systems with no problems.  This
was some 15 years ago so I don't remember the exact swr readings
but they were not any where near 3:1 and the performance was
very good.

Your 3:1 SWR and poor performance indicates a short or open at the antenna end of the feed line.  Even
3:1 is only 25% power reflected back and most of
it is reflected *again* at the transmitter ( minus 2x line loss) and goes
back to the antenna. Very little performance will be lost.
Perhaps there's a kink or dent in the line or a bad connector.

Anyway, replacing it with known good 50 ohm line will probably fix
it.  I just wanted to defend the use of good catv hardline.

Bob,

I have a suggestion that I'd like to throw out to all on the list...

RE: WX displays

        I like the new optional WX display formats on screen. However, my
area is getting more and more stns and I used to run with CALL's turned
OFF. I like the optional WX data displays so much that I now run with
CALL's turned ON. This clutters up the map greatly (at the scale I like
to use)  If I use Just Wx I will not see the normal stations.

I would really like it if there was some way to show ALL of the icons,
but NO CALL's except for WX stns?

Hi Jamie:

Could you give me the lat-lon on your digis in NC(western). We have several
mountain top digis in eastern TN and would really like to get linked up to
NC but I guess the mountains are preventing that.  I did see one testing at
Mt. Mitchell, but it never came back.  Thanks

There is quite a bit of work being done on Mac/WinAPRS exactly on these
lines.  It is a long way from finished but we are designing in much of this
type of capability.

Mark

Hello I downloaded v 77d yesterday, and was trying to set OPS Digi
paths. I used O - d S and it never saved my path. Anyone else
having the same problem??

I have been following the list for awhile now, I finally got a
computer and I really want to get started with APRS. I do not have a
ham license yet, but I want to see whats going on in my area (22mi.NE of
Seattle WA.). can someone reccomend an inexpensive receiver/scanner
and maybe do a little bit of elmering?

Thanks for your time

>that claimed to make the 75 Ohm Cable behave and look like 50 Ohm cable
>to the radio. After it was installed, the SWR at the rig was over 3:1.

If you use 75 ohm coax in a 50 ohm system WITHOU ANY TRANSFORMERS, the
SWR is only  1.5:1  (i.e. 75/50). In the real world, this is an insignificant
mismatch. The only downside to saving money by using 75 ohm coax is that
suitable connectors are a hassle.

73, Tom

Yes I got it now, but it wasn't there the two times I logged on. And as Bob
posted later he didn't upload it when he tought he did. I maybe getting old,
but not that old that when i looked twice and still didn't see it I was sure
No matter what anybody says Hi. John i'm sure you got it later in the day.

The Motorola Amateur Radio Club of Arizona is proud to announce the
operational status of a new APRS WIDE-RELAY digipeater in the Phoenix
Metro Area.  The frequency is 145.79Mhz and is located in Tempe.  This
site will serve the entire east valley and most of Phoenix.  Actually,
W8FWF in Sun City West is solid copy into it, so coverage may be greater
than anticipated.

Robert,

Can you call me or give me your number so I can call you
to discuss the problem your having further. We have spent
two days on trying to simulate your problem, nothing. I still
have a feeling that it's your data cable or MPA, is their a way
you can check these, try diconnecting the antenna unit to make
sure nothing is shorted in one of the logic lines there, and
running your test with the GPS to DFjr and then to the PC,
everything the same less the antenna plugged in.

Thanks!

Rendered body type: text/plain

The report was correct that you cannot USE the 12th entry in your OPS-DIGI list in 77d. WORKAROUND is to put a dummy path there by just making your first entry be XX, then all will work normally.

Buy a Kantronics KPC-3. Don't buy any other TNC as a beginner. If you like
APRS/Packet you can always buy another TNC later if you want more features.
And I bet you will still use the KPC-3 even after purchasing another TNC. I
have FIVE TNC's (including a 9600 bps Paccomm Spirit-2) and use the KPC-3
most consistantly.

Any scanner, even a 25 dollar used one, should work well for monitoring
APRS. Or, any 2-meter HT, used or new is also appropriate. Standard has a
new 2 meter HT with alphanumeric display for under $200. ADI also makes an
inexpensive 2-meter HT. I have found older non-pl, non-DTMF, 2-meter
transceivers for under $50. Some are crystal controlled, and those may be
difficult to put on 145.79 MHz. I recommend buying a new HT. I looked for
two years at hamfests for someone asking a "reasonable" price for a used HT
and never NEVER found one. I still can't understand why MOST hams think
that their 10 year old non-PL, Non-DTMF, with a dead battery, HT is worth $175!

That's my 2 cents

Bob, while you are taking request...grin...

Would it be very difficult to incorporate someway that we can reset the
rainfall amounts displayed by APRS. I have had the power go out at my
place a couple of times and each time that aprs has come back up, it has
not displayed the correct rainfall amounts for the last 24hr period, and
in some cases the last hour.. Evidently APRS keeps track of this info
instead of allowing the Wx stat to do it.. I am using a Ultimeter 2000,
and it keeps track of this info..

Thanks for even considering this..

Don

Why such a glowing endorsement for the KPC3?  Given their non-expandable
nature, I'd hesitate to recommend it to anyone, as there are several other
TNCs at the same price that CAN be expanded.  I'd also think twice about
buying ANY TNC that used a nonstandard default command set, regardless of
the reason.

Of course, to paraphrase P.T. Barnum, you can always find a buyer for it
after you've outgrown it.

I've been running an MFJ-1270 (no suffix) for many years now.  I can still
drop the latest ROMs in it, and have the same features as the ones still
in the box.

I personally use 345' of 3/4" CATV jacketed and flooded aluminum
hardline with ZD matching transformers on 2m for my packet BBS. It's
SWR is less than 1.5:1. The added advantage to the 1/4 wave matching
transformers on 2m, is that they become 3/4 wave matching transformers
(with broader bandwidth) at 70cm! Don't have to buy the 70cm matching
transformers... And the hardline was dirt-cheap! Thought I'd clear the
air on 75ohm hardline and ZD's matching transformers as to whether they
really work or not. They Work! Regardless of length of the coax.

I agree with Dale, the line may have had a kink or RF upset somewhere.
Or, perhaps the transformers may have been bad. Made by a human, so it
is possible, I suppose. My luck with them has been positive.

You give exactly the reason why I recommend the KPC-3 to the beginner.  It's
a straight-forward, no frills, TNC.  As the packet coordinator for an
amateur radio club, I field a lot of phone calls from people who've just
bought their first TNC, usually one of those $500 jobs, and they can't get
it to work.

The KPC-3 is small, can be run on a wide variety of voltages, and draws
little power.  Dirty power supplies don't phase it.  I have two other TNC's,
one an AEA, and the other a PacComm, that crap out unless they're hooked to
a very clean, stable power supply.  This makes them USELESS for mobile work.
The AEA will lock in transmit if the voltage drops too much!

The KPC-3 is great for portable packet.  It interfaces with GPS units
easily.  It has on-line help functions.  Yes, it has a non-standard command
set, but so what?  That's what manuals are for.  You can add stuff:  more
memory, a real-time clock, and upgrading the ROM is a snap.

The KPC-3 is inexpensive.  How many times have I seen hams and non-hams buy
a $500 toy, only to lose interest in it 3 months later?  In this case, the
KPC-3 will leave your wallet a lot thicker when leaving the Ham radio store.
```

```
>
>Of course, to paraphrase P.T. Barnum, you can always find a buyer for it
>after you've outgrown it.

Who can live with just one TNC?  How are you gonna monitor DX-cluster and
tranfer a binary via pactor at the same time on your one do-it-all-in-one
box?  Are you gonna dedicate a $500 TNC for mobile APRS use in your car?
And once you put that TNC in your car, what are you going to use at home?
Remember, this person asked for a TNC that works well with APRS!  Again,
I've expanded past the KPC-3, but that doesn't mean it sits in my closet
collecting dust.
>
>I've been running an MFJ-1270 (no suffix) for many years now.  I can still
>drop the latest ROMs in it, and have the same features as the ones still
>in the box.
>
  There is nothing wrong with the MFJ 1270.  It's another good, inexpensive
TNC, or at least I've heard that.  I've never used one, but several people
who have, steered me towards the KPC-3, stating that I'd be happier with it
in the long run.

Great to hear it.  Now if we can just find a site in the West Valley.

As for George, W8FWF, of course he can hear it with that tower of his!  I
can always copy him, but he can never hear me from 47th Ave and Northern.
Granted, my external antenna only has a southern exposure.  The surrounding
chicken wire mesh (under the stucco) and steel studs in our condo complex
make a pretty good Faraday Cage!  If I crank up the 50 watt radio to hit
him, it sure disturbs my neighbors.  Nothing like wiping out everyone's
cable TV in a 100 foot radius!  I've considered asking the homeowner's board
for permission to put an antenna on the roof, but they might say yes.  And
then I'd really be in a bind...and about $300 poorer.

BTW, monitored 145.79 for about an hour tonight and heard nothing.

Yes your right Scott, that's a big bug!. Not only will it not save the
path but here is what i get. When entering a digi path and then doing the
ALT-S for saving it it still doesn't work. The strange part is that when
entering a digi path, the path it will show is a coordinance of
75049,86.67401,16
And it will show this everytime as a path. I even got out of APRS then
reloaded it and no path was saved.

Would recommend to the individual that wanted to experiment with APRS and had
not received his license "first" let us know what part of the world he/she is in
and perhaps a local Amateur Radio Operator will invite you over to their station
to see APRS working first before you purchase any equipment.

To Bill and others having problems with the Opps-Digi command...

I just loaded the 77to77D upgrade. Since I have a registered copy,
I also have a config file...the O-D paths store in the Config file.
I saved the config file from 7.7 [I keep it on disk so I can play with
different versions of APRS] After I loaded the upgrade, I used
Xtgold and changed the config file name and also changed the
line in the config file from 7.7 to 7.7D. The O-D command works just
fine, however I did loose the 12th path. As long as there is a problem
with the O-D command I will make my path changes using Xtgold
instead of thru the program.

In the NEWNOTES.TXT for 7.7d, Bob states that you can continue to use your
7.5 config file but you need to add 0,0 just before the lines that contain
your digipaths (or just ahead of the *'s near the end of the file if you
don't have any saved!).

While I haven't tried to save any new paths, my old paths DO seem to work.
I suspect that there may be a problem in the save function now rather than
the config file itself.  Perhaps the SAVE function is over-writing the 0,0????

At any rate, try resurrecting your config file and doing the manual edit.
If that works then we'll know the answer...

503. WinAPRS version 1.1.5

From: Mark Sproul <sproul@ap.org>
Date: Wed, 23 Oct 1996 11:00:02 -0400
To: aprssig@tapr.org
Message-ID: <v03007802ae93e088f6e7@[165.1.27.171]>
Rendered body type: text/plain

```
I have posted WinAPRS version 1.1.5 up on Rutgers

        http://aprs.rutgers.edu/APRS/
or
        ftp://aprs.rutgers.edu/pub/hamradio/aprs/

I will be posting it to TAPR in a little while.

There are 2 files

        WAPRS115.ZIP                          1070 Kb    Tue Oct 22
22:01:00 1996
        W115UPDT.ZIP                           229 Kb    Tue Oct 22
21:59:00 1996

The first is the full release including maps, the second is just the .exe,
the DLLs and the help file.  If you already have WinAPRS you probably  just
want the update (the 2nd one).

There are only a few changes in this release.

        A fix to a problem with parsing data from a Ultimeter weather station.

        Fixed bug in Auto Start - previously only VHF would auto start,
none of
        the other ports would auto start correctly. Also fixed conflict
between
        auto start and serial debug mode.

        Memory usage window.  This was added to try to track down some problems
        several people were having with memory leaks.  So far I have not been
        able to prove anything with it either way but if you are having
problems
        you might find it interesting. This window is NOT for general usage,
        therefore its contents may seem cryptic.

        QRZ CD-ROM has now been tested and is working properly. You need
the index
        file from our FTP site.

        HSP is still not done but its getting real close.

We should be completely caught up on registrations.  If you have sent for a
regration and have NOT received it, let us know ASAP.

Mark Sproul

Greetings,
I have been monitoring the SIG for sometime and this is the first my first response.
I AM registered and I have read OPS.txt etc.
7.7d seems to work fine and will save (sometimes) the Digipaths "ww, rw, no" also can manual edit. But I found out by pressing just the "u" the original "ou" response is displayed. I filled in the info and returned to the map screen. Then did alt "s" and saved my config. I left program and returned and the proper digipath was there. I did have the error messages "can't save etc. appear when I tried to follow the new procedure again so I don't know what I did. I will be monitoring for help also.
Thanks

A 100 ft radius??? You better check that radio with a spectrum analyzer, before using it again. I can rotate my beam around and point it directly at my TV antenna, hitting it with 200W ERP (at about thirty feet distant) and still not get any interference at all.

>Ever Heard of the Paccomm Tiny-II?

Yes, I have.

Remember, another person asked for suggestions. Most of the responses I've seen have been made to me, and not any helpful hints to a new user of APRS (which is what started this). Perhaps you might like to offer an opinion as to why the PacComm would be a better choice than a KPC-3.

PacComm TNC's are not as common as the KPC-3, and it might be harder to find a local elmer who knows much about them. They are not carried by any Ham Radio Stores that I've been to. No local purchase access is a downside, IMHO.

One feature I forgot to mention is that the KPC-3 has a remote sysop function which allows one to alter the TNC's settings by radio. This is a very helpful feature when using and setting up APRS, especially in mobile trackers. PacComm does not offer this.

To recap, the KPC-3 offers many postive traits to any user of APRS.

-Low cost
-Good local availability
-Many in use
-Accepts a wide variation in input voltage
-Immune to line noise and power fluctuations
-Very Low power consumption, can run for hours on a 9 volt battery
-Easy to set up for use with a GPS unit
-Interfaces with a GPS unit unbuffered
-parses time into its internal clock via GPS
-Remote sysop
-small physical size
-low weight
-On-line help
-reliable
-easy to wire up to transceiver
-no deviation settings to mess with, it just works

All of these features make it a very good choice for APRS.

73,

Mark Fellhauer

aprssig@tapr.org said:

>I went to download the files and they were both empty.

I tried to ftp the smaller of the two and it timed out my ftp connection
after about 70k.

The files are on the tapr web site...got both files (update and full ver)
in a matter of a few minutes.

My experience with the rutgers ftp site has never been good, although I
always try it at least once. TAPR site works much better for me.

Hope to have it on after work later today. 73,

URL for the files:
ftp://ftp.tapr.org/tapr/SIG/aprssig/files/winstuff/WinAPRS

You can ftp to the same site/directory structure by just ftp'ing tapr.org
and changing to the proper directories. Directory names can be CASE
SENSITIVE.

Update Only: w115updt.zip
Full Version: waprs115.zip

Hi Mark

Perhaps I should appolagize for sending a one liner as they always seem
to generate a negative response. In my opinion one should duplicate
their elmers setup to reduce the learning curve. Also I was just
offering an altenative to the KPC-3 as the conversation was seemingly
focused on standard command sets. The Tiny-II meets the criteria being
discussed and has the standard command set. Also if you have a local ham
dealer you are probably in the minority as most of us pick up the phone
to get anything new in ham gear. Again my intention was NOT to throw you
off or piss you off! Hind sight being 20-20 I can see how my one liner
could be perceived as a "speer" which was not my intention.

Well, all my radios do it to CABLE TV, including the radio I mentioned,
which is an FT-8500.
Remember, some cable TV channels are transmitted in the 2 meter band range.
My 5 watt HT will wipe out the cable in the lower channel ranges (around
channel 18 especially). It's been scoped a few times and is well within spec.

I find it hard to believe that your radio won't phase a TV at 30 feet. Most
of my RF transmission devices will cause at least some interference.
Clunks, wavy screens, etc. My gold-stickered RC transmitter does some
really goofy things to my computer monitors. You can actually see the RF
pulses. (G)

Here's another 2 cents. KPC-3 TNC, crystal controlled radios. I have
three KPC-3's all dedicated to APRS, one of which is a digi. I also use
have three crystal controlled radios. You can pick those up at a hamfest.
Forget the scanner, just don't hook up the trasmit side of the tnc until
you get your ticket.

That is feasible. Remember that CATV uses part of our 2 meter, 220, and 440 spectrum. If there is a cable leak, 2 meters WILL wipe out channel 18 at least. An old CATV axiom: "Where there is egress there is also ingress".

Actually, it may wipe out channel 18 without a leak, if he's close enough. The problem is that of the CATV company, and the owners of the poorly shielded TV, but try telling that to an irate neighbor.

He said CABLE TV. You said you have an antenna. You are not watching CATV 18 if you have an antenna, I believe.

519. 75 Ohm CATV Hardline

From: kr4ol@juno.com
Date: Wed, 23 Oct 1996 15:52:58 PST
To: aprssig@tapr.org
Message-ID: <19961023.155306.32487.0.KR4OL@juno.com>
Rendered body type: text/plain

Good Grief! I'm real sorry guys! I did not intend to start a debate on the merits of 75 Ohm CATV Hardline with my previous message regarding our experience with it. I am a strong proponant of using surplus material for HAM purposes. Most of the equipment I use for packet and APRS is surplus gear. I can assure you, I looked into it very carefully before putting up the CATV hardline and was sure we could use it with little trouble. I also think the fine folks at ZD Manufacturing do a super job. Their literature and service speak volumes of the personal care they put into their product. If another HAM were asking about using CATV hardline for a similar application, I would, of course, reccomend 50 Ohm Hardline over the CATV Hardline, but if the situation is similar to the one we faced when trying to get our system on the air, I would reccomend using the CATV Hardline without reservation.

My purpose in addressing this in the first place was in response to another sysop's reccomendation that we leave our CATV hardline in place. If I had been able to track down the problem in this hardline, I

might be persuaded to leave it in place. Let me assure you, we have
searched very carefully for the culprit and have found none. No "kinks",
connections are sound, jumper cable at the antenna is good. Perhaps it
could be a "bad" transformer. I agree, it could happen. At any rate, I
have recently had donated enough 7/8" 50 Ohm hardline to replace the
CATV hardline. Now, what would you do?

I appreciate all the responses regarding our efforts on getting
KR4OL-2 on the air! I first started using APRS in February of 1994 (I
think it was ver 7.3a). The group in Georgia has grown coniderably
since then! It isvery nice to boot up and see so many stations on the
map! Thanks for hearing me out, and I hope I have not offended.

Hi, All

I have a question for mapmakers.

I have recently created a bunch (50 or so) new maps using mk100k3.exe
which should help organize my Boston map series...

I now want to make a maplist using mkmaplist.exe/bas.
I run the make maplist program (I use it renamed for brevity)
and I get the directory file but it wont create the psudo maplist.## file

My question: is there a change in the maps that doesn't allow the list to
be made or am I missing something??

Scoped? As in Oscilloscope? That won't tell you much at those
frequencies. If you are clipping your RF signal, you will be generating
odd harmonics. The "O"scope won't display the waveform distortion on a
2M frequency, unless the "O"scope is good for at least 450Mhz. Even then,
you won't see the clipping, but you will see some distortion of the
waveform. To actually see the clipping, you should be using an "O"scope
with a bandwith of at least 10 times the frequency you are looking at
(for 2M that means a bandwidth of 1,500Mhz). That's why I suggested a
spectrum analyzer.

>I find it hard to believe that your radio won't phase a TV at 30 feet. Most
>of my RF transmission devices will cause at least some interference.
>Clunks, wavy screens, etc. My gold-stickered RC transmitter does some
>really goofy things to my computer monitors. You can actually see the RF
>pulses. (G)

Fortunately, for me, your lack of faith does not affect my reality :-)

Before Hurricane season, I had all my 2M antennas stacked over my TV
antenna, with the Radios (Alinco DR-150T and DJ-582) on an end table,
near the TV and my stereo. There was never any detectable interference,
in the video or audio of either system.

```
At the beginning of Hurricane season, I stuck up another mast 30 feet
away, to reduce the wind loads on the, el cheapo, Radio Shack rotor. I
still get no detectable interference.

Since then, I have relocated my radio equipment into an extra room, on a
shelf directly above my computer, to keep it all together for APRS. I
also get no interference there.

The only time I have ever experienced any interference, from my 2M
equipment, was when I was testing a homebrew three element quad in the
kitchen. It set off the smoke detector and the cats went crazy :-)

In a message dated Wed, 23 Oct 1996 15:58:14, Ralph wrote;

>He said CABLE TV.  You said you have an antenna.  You are not watching
>CATV 18 if you have an antenna, I believe.

You are right there, Ralph. The cable doesn't come within four miles of
my home. However, Mark said that he was causing interference which would
"wipe out the cable". This doesn't sound like a single shared frequency
problem. Considering that one single TV channel is 6Mhz wide, he would
have to be using spread spectrum to cause that much interference if
everything is working right.

Admittedly, the fault may not be in his radio. But it is the easiest
thing to check out. So, logically, it should be eliminated before
progressing to other checks.

regards,
Joe kf4dys

WB0WNX-7 Mojave Mobile has been active the last week. Last week there was a trip from Sioux City (SUX) to Kansas City International (MCI) and back. Two days later there was a trip from SUX to Columbia, MO and back. Yesterday a trip from SUX to Kansas City Downtown (MKC) landing during a blizzard that dropped 7.5 inches of snow at the airport (IN KANSAS CITY!?). Tomorrow SUX to Chicago and back departing SUX about 0830L. I would appreciate and and all track recorded to be E-Mailed to me for future demonstration purposes. Oh yes, plan on going to Minneapolis (St. Paul Downtown airport) for the Minnesota Hamfest this weekend.

Interesting string, it started talking about the new AZ wide, and the last message I read was talking about TVI. Sounds like someone has a missing ground or leaky shield in their local cable tv network. And the new tv's usually have cheap or non existant shielding, and can be penetrated by a 5 watt cb just as easily as a gallon 2 mtr rig.

Today was the first day I had a TNC and radio sitting on 145.790 here in
Norfolk and I saw only one station with APRS data and it was not AA3NM. I
was told by one of the current APRS users here in Norfolk that their is no
"wide digi" available so I suspect coverage is limited in the area currently.

Especially, when you're dealing with Dimension Cable (Now COX).
I can watch cable on my TV not connected to the cable!
And now they're trying to sell internet access via cable modem and want to
get into the telephone market.
Great, I'll lose my phones and internet access every time it rains or the
wind blows, just like the cable TV.

They actually told me their equipment was maxed out at 50 channels which is
why we can't get any of the newer cable channels.  (g)

They also told me that the ghosting through the cable was caused by nearby
TV transmitters, but I stood and watched the cable repair woman turn the
gain down after she peaked my set.  She was in the service closet of my
condo complex replacing a splitter and the picture got very good and the MTS
stereo popped on (on channels I never get in stereo).  She then backed the
gain down, so the local channels come in ghosting.  And then she denied it!
How stupid do they think I am!  I'd go DBS if we didn't have 3 TV's hooked
to the cable.  I might get one anyway, when systems drop to under $200 (with
no rebate).

Oh well, back to APRS.

Mark

Frequencies in use by cable companies:

Chan 18 Broadcast-495.25 Cable STD-145.25 Cable HRC-144.00 Cable IRC-145.15

If you ever want to see how leaky the system is around you, tune to
145.25 (works best). I used this freq with APRS/GPS/DFjr setup to show
the cable maintenance manager where his leaks were. Didn't make him mad
either! The guy calls me regularly to see if I have found any leaks
lately. Small town.

Rendered body type: text/plain

```
To all WinAPRS users

I FINALLY have HSP working.  I will be releasing version 1.1.6 by the end
of the weekend.

Currently it works on Windows95 ONLY.

The first release will contain new versions of the Serial32.dll and
SerThunk.dll.

I do not have the Win 3.1 DLL working with DTR yet. Once that is finished,
it will be a simple matter of getting new version of Serial16.dll.

I have been testing with a PacCom HSP cable, currently HSP is switched for
4 seconds out of each minute.  User settable rates will not be available in
this first release.  I do not know how important it is to have user
settable rates so if you have any thoughts on this, let me know.

Now that my NUMBER ONE PRIORITY is almost completed I will have a chance to
first take a breath and a sigh of relief.  Then I will get on to other
enhancements and additions.

Thanks for all of your support and patience

Mark Sproul

> problem.

True. However, that's not the usual way that CATVI works.

CATVI usually happens through physical damage to the system, usually caused by people trying to steal cable. This allows signals to get into the system.

Since the amplitude of the 2m signal us huge, compared to the regular cable signal, and in the passband, it drives the amplifier to clipping. It's this overloading of the amps that usually cause the entire system to be affected.

Basically, it's simply "front end overload".

Greetings Sig:

Orange County RACES is planning to use APRS in Orange County the night of the elections to track a few vans carrying ballot information. This is a test only.

Unfortunately we do not have adequate street maps for Orange County, CA for us to demonstrate APRS capabilities.

Therefore, we are putting out a request for any street level Orange County maps that may be in the system. We have Cala, and Socal but they only show the major highways in LA.   There must be someone out there that has made more detailed maps????????

We have a lot of CD-ROM's with detailed street maps, but until Mark & Keith Sproul release their conversion program we feel we are out of luck.

Any ideas or maps??

Thanks to all that reply.

KM6YH,
County of Orange RACES

Ken,

I can, and have created APRS street level maps of Orange County based on
USGS 100k maps.  What particular area(s) of OC do you need?

One thing to consider though is that the USGS source CDs are somewhat
dated. I estimate that some of the data is no more recent than the late
70's.  Hopefully the streets you are interested in have been around a
while.

Just bouaght a 9612 and it's nice! The paging functions look interesting
if there is a local interest. Would come in handy for ARES/RACES personel
notification. Or a backup to some other system. Any APRS functions that
you can think of?

> while for testing and such. Any Help?

APRSdos REPLY/COMMENT: The WIDE command has been out of APRS for 6 months or so. Since every station, includeing a WIDE should also have the alias of RELAY, the only correct way to have a WIDE-RELAY is to use a TNC which can have 2 aliases. You can use the PACCOMM or the KPC-3. Just set one of the alternalte aliases to WIDE. Then APRS will leave it alone...

To: APRS dicussion group <aprssig@tapr.org>
Message-ID: <326FE38B.359C@cyberenet.net>
Rendered body type: text/plain

Hi All,

Anyone know if there is any activity in the Altoona, PA area. I know there is now N2CHV-2 on Blue Mtn in Harrisburg, and occasionally I would see a station marked as WIDE in Hagerstown, MD.

Is there any APRS activity in Pittsburg also? For anyone who might be in that vicinity please leave packet mail for no3a@w3syy. He's not on the 'net and as far as I know there is no gateway setup for w3syy as I've tried to send email to w3syy.ampr.org which got returned.

Anyways, Mike and a couple others are trying to get APRS started in Altoona, and are looking for others in the area who may already be running APRS or are interested too.

I have noticed the problem with the O D S and have what appears to be a couple of others..
1. My saved maps (1,3,5 etc) were scrambled
2. The X B does not send. X P works!

One other problem, which might have been Operator error,(who me?) I renamed my CONFIG files to 77d. The APR extent ion seemed to work OK but the HF extension would not. I finally had to enter the program from scratch and save it.

Rendered body type: text/plain

```
I will be adding a QRU command to APRS so that sailboaters can turn off
their RECEIVERS as well as transmitters on long sails.  At the Academy, we
find that an SSB radio draws 1.7 amps on receive and the 286 laptop draws
.3 for a total of 2 amps.  Although the 100 amp hour batteries should last
2 days at this rate, most skippers are concerned.  (Transmit current of 20
amps is insignificant since it is on less than 0.5% of the time).

With a QRU query packet, I can have the laptop turn oFF the HF between the
15 minute position periods.  THen turn it on to send its beacon, posit and
the QRU packet.  THen it listens for 1 minute before turning off the HF
again.  Every station hearing the QRU packet will scan its MESSAGE list
and if it has an outgoing packet for that station, it will send it.  THis
way, the sailboat will still RECEIVE traffic, even though his receiver
is OFF 92% of the time!  This reduces the average current drain to about
0.4 amps for a factor of FIVE improvement in battery life!

I still dont see any sailboats on HF, and very few of the waterway boats
if there are any, but this will be easy to do if they want...

Ok, this isn't exactly an APRS question, but maybe someone can help.

I'm trying to get my Accunav Sport to send data to my Mac, but so far,
I'm having no luck.
I think I have the correct pins connected, but someone mentioned I might
need a diode or something for the RS-422 port. Not knowing _alot_ about
it, I'm turning to you all... the experts.

Any help would be greatly appreciated!!!

Thanks.
Ronnie

It would seem to me that this would also be great for just plain ol'
mobiles, too!  How about people like Peter (W7LUS) who are on the road for
long periods.  Would also be good for the RV'ers out there, too!

That Ok it is asked all the time

>I'm trying to get my Accunav Sport to send data to my Mac, but so far,
>I'm having no luck.
>I think I have the correct pins connected, but someone mentioned I might
>need a diode or something for the RS-422 port. Not knowing _alot_ about
>it, I'm turning to you all... the experts.

The Mac serial ports are RS-422 BUT all pre-make cables have one side of the RS-422 "balanced pair interface" input connect to ground to make it RS-232

That looks something like this:

```
       DIN-8 MALE                       DB-25 MALE

       GROUND 4 O--+--------------------O 7  GROUND
  RECV DATA + 8 O--+

  RECV DATA - 5 O-----------------------O 3  RD (Receive Data)

  XMIT DATA - 3 O-----------------------O 2  TD (Transmit Data)

HANDSHAKE OUT 1 O--+
HANDSHAKE  IN 2 O--+--------------------O 20 DTR (Data Terminal Ready)
```

You must roll your own cable by using a 8-pin to 8-pin cable and cutting off one end.

8-pin mini-DIN connector on the back panel

```
    notch
   8  7  6

  5   4   3

    2   1
```

Pin number	Signal	Function
1	HSKo	Handshake output
2	HSKi	Handshake input
3	TxD-	Transmit data -
4	SG	Signal ground
5	RxD-	Receive data -
6	TxD+	Transmit data +
7	GPi	General-purpose input
8	RxD+	Receive data +

```
GPS            MAC Signal        MAC pin
------         --------------    -------
GPS Data Out   Receive  Data -    (5)
GPS Data In    Transmit Data -    (3)
Ground         Ground             (4)
------------------------------------------------
```

The RS-422 will be a better match for the almost TTl like

output of most GPS units. IF your unit output true S-232
than per-made MAC RS-232 cable will work.

Note : IF you do run an input TO the GPS don't overdrive it.

For a Garmin-45 user the cable would be:

```
GPS 45                  Mac              PC User 9 Pin
----------------      --------------    ---------
Data Out (Brown)    Receive Data  (5)      2
Data In (White)     Transmit Data (3)      3
Ground (Black)      Ground        (4)      5
Power(+)(Red)       No Connection
```

Hope it works with pico mode, too (where it sends a ctrl e for the posit).
It is very important to have HSP user settable, I think down to every couple of seconds or so. This is, of course for tracking your progress (mapping).

Not having used WinAPRS mobile yet with GPS (because of no HSP), I don't even know if you have such a mode. But if you do, I think we need to be able to get posits for local screen update that often. The pico can easily switch once a second without causing errors on DosAPRS.

Louis, you can download it from my BBS.   I got the 77D versions from TAPR
and uploaded them to these two the other day:

410-256-0170  33+kbps   Area HAMCOMM

410-252-6238  14400 bps (W3FT Baltimore ARC BBS)  Area HAMPKT

Once you get *a* copy, there is a list of the official distribution boards.
I'm not yet on there, but should probably ask to be.

566. Remote U-II's

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 25 Oct 1996 09:34:49 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.961025093105.14356A-100000@arctic>
Rendered body type: text/plain

I figured out what is going on with remote U-II's. What APRS does is
overwrite the POSIT on the P-LIST with the WX data when a raw U-II packet
come in. When a BText from the same station contains the POSIT info, it
overwrites that too as it should. What you have to do is make sure that
the BText with the POSIT has no other text in it beyond the _ wx symbol
character. That way, it will NOT overwrite that portion of the posit.

So the software IS working as I designed it. But BText must contain only
the posit and no text.

I would like for the BText to contain some other info, but havent figured
out how I want to do that yet. So for now, cut the BText to POSIT only.

567. GPS & Window DeIcers

From: Pat Bunsold <pbunsol@cati.csufresno.edu>
Date: Fri, 25 Oct 1996 06:30:44 -0700
To: aprssig@tapr.org
Message-ID: <199610251330.GAA29421@CATI.CSUFresno.EDU>
Rendered body type: text/plain

I have used my Trimble Mushroom GPS all summer with excellent results in the
rear window shelf of my car and usually get about 5 to 6 satellites. But
today I was shocked to see NO SATS at all being recieved! After checking all
possible causes, I turned off the Rear Window DeIcer and suddenly all the sats
reappeared. Evidently, when off, these wires do not interfere with sat n, but when powered, act as a
Faraday shield or such blanking out reception!
So, those running rear window GPS's, Scrape off the ice if you want to have
your tracker work! 73, Pat WA6MHZ

Bob: I'm not aware of anything in Altoona yet, but I drove through
Pittsburgh last May and did hear activity on 145.79.

If the Altoona group decides to set up a WIDE, a site on Sideling Hill
(near the PA Turnpike) should be able to hit N2CHV-2 reliably, and would
receive mobiles on I-76 and I-70 toward MD. They will probably want to
build another WIDE west of Altoona to cover the Johnstown area, too.

APRSdos REPLY/COMMENT:  Yes, and no.  Like anything, idiots can abuse it.
If a station has ample power like ANY mobile with an engine, then he
should keep his HF receiver on all the time and should *not* burn up
bandwidth sending QRU's all day long.  But yes, for a mobile that has gone
QRT for a few hours, he can send one QRU when he is on the road again to
see if he missed anything.

I can only give you pros about Peet:

1. The U-2000 is a dream to use. Easy and very powerful. Excellent
   interface to APRS.
2. SUPERB customer service. Responsive, fair, fast.
3. I have used 2 U-II's and one U-2000 and had excellent luck with
   all of them. There were some early problems with both the regular
   temp sensors and the combined external humidity/temp sensor.  4. Price
is reasonable and they have maintained some form of upgrade
   path so your existing peripherals work with their upgraded control
   heads. The old heads can even be used as remotes!

575. GPS-20 question

From: Mel Muecke <MMuecke@InterfaceTech.com>
Date: Fri, 25 Oct 1996 10:25:42
To: aprssig@tapr.org
Message-ID: <19961025102542.29045737.in@InterfaceTech.com>
Rendered body type: text/plain

Hi gang!

I bought a GPS-20 and hooked it up to see that it works. I didn' have an antenna handy, so I tried the trick with a piece of wire. I connected the serial output to my Newton, and watched the strings come out of the unit for quite some time. The satellite numbers kept incrementing like it was searching the sky for each one. I don't remember which string was showing what, but got the impression that it was going through a cold boot sequence. When it was finished, it showed 00 satellites received, and the lat/lon never appeared.

Since the first power-up I have transferred my homemade amplified patch to the cable provided with the unit, and have left the GPS-20 running for a few hours. It never shows that it is receiving any satellites in spite of the fact that my garmin45 is sitting next to it with a full house. I know the antenna is fine, I had been using it with the garmin45.

I was wondering if there is any way to get the unit to go through the cold boot sequence again without shorting out the backup battery?

Does the unit only look for the satellites it expects to see in the sky over the last place it got a lock (garmin factory), or would it see the ones in view and lock onto them? In other words, when it says it is not receiving ANY satellites, does that mean ANY, or not any of the ones it is expecting?

I was trying to enter the lat/lon and time manually to see if that would fix it, but am having trouble getting the GPS-20 to accept input from the Newton. It may be a cabling problem, since the Newton is RS-422 and I'm not sure whether it thinks it is serial or appletalk network. I got the cable hookup for Macs a couple days ago, and will probably try that this weekend. If ALL else fails, I can dig out my old PC and talk to it that way.

Any info would be appreciated.

Thanks,

Mel

Well I was wondering why my 2000 data would not show in the little data
box at the top of the screen. I am also not seeing the wind direction
indication on the blue dot. Is this caused by the same problem ?

Another question....does the packet mode of the 2000 work w/aprs or
should I keep it in the gps mode ?

Yep!  When I got home from work, I saw the boat had just gone by.  I
first copied position reports as he approached downtown Norfolk in the
Elizabeth River.  I managed to PING him as he traveled south into Pungo
(South Virginia Beach).  He was using a standalone tracker on 145.79
when he passed through here...raw data.

```
TAPR GPS-20 Group Purchase Information
---------------------------------------------------------

Due to the popularity of the GPS-20 group buys, TAPR plans on just taking
continuous orders.  Thus, TAPR will take orders for around 100 units and
then do a purchase and then start another buy right away.  Please remember
that an order with payment must be received to get a unit -- this is NOT a
collection list for purchase.

The current GPS-20 orders are being shipped this week and next.  TAPR is now
taking orders for another batch of 100 units.

OK, but what about those of us who use TACTICAL CALLSIGNS for the MYCALL and
satisfy the ID requirement by including the actual station callsign in the
BText? Means that my WX stations can no longer post on maps as MCI, MKC,
etc....

Bummer!!!! I'm vain as the next guy but even >I< get tired of seeing 8 or 9
posits on the map all with MY callsign on them!

Hello All

Having been on the sig now for some months and have enjoyed reading the
comments.

I would like to know if there are any maps on Australia and if you can get a
listing or Longitude and Latitude co-ordinates world wide.

Thanks in advance

I didn't think I would ever do this but I have decided to give up running
APRS altogether. I have for a long time now been doing some checking, and
this is not so easy task about where and how my signal is going and
through what digi etc. I had an idea that a certain indivitual was
Budlisting my call and am now convinced of that. After watching WA4DSY
internet server for a long time i noticed the call WA8INZ never shows on
that list. So testing again this morning with me 300W and my stacked
13B2's directed right at a digi that does show up in the list all the
time (By the way I see that digi direct) I never ever see my or my digi's
call show up on that list. When some users are sinking that low to
budlist users because of a dissagreement between two people then i don't
want anything to do with such a group. Therefore I will discontinue using
APRS and will be removing my APRS webpage from the internet. Sorry there
are a great bunch of people on both the sig and those running APRS, but
budlisting users is uncalled for. I will leave the digi up and running in
Huntsville since I won't sink to that persons level. It's been great
while it lasted guys. I have been running APRS pretty near from it's
start and have enjoyed it, but there are some people that just will never
give up. I know I have upset people both here and while running APRS and
i'm sure there are those that will be glad to see me dissapear, and some
dislike the fact that I speak and put down in words what i feel and I had
always thought this was a free country, but I guess there are those that
```

think a dictatorship would be better. I know my letterwriting is not the best in the world and I don't realy have the skills to express myself to well but i'm sure most people got the drift on how I felt. 73 Bill WA8INZ

589. static scrambled the Digi

From: joefoor@digitalexp.com (Foor, Joe)
Date: Sat, 26 Oct 1996 09:34:43 -0500
To: aprssig@tapr.org, aprs-fl@tapr.org
Message-ID: <19961026143441841.AAA171@dial-12.marianna.fl.digitalexp.com>
Rendered body type: text/plain

Hi All;

Our EPAN wide area digi was becoming less sensitive, with an apparent reduction of about 20db, after several days.

Over the air tests, using voice on the digi's radio, proved that the problem was in the TNC.

Observing the operation, we could see that there were packets being received, but the digi wasn't retransmitting them. After 30 minutes of failing to get the computer to communicate with the TNC, I swapped out the KPC-3, replacing it with my own.

Immediately, it became apparent that there was a receive audio problem, with the TNC Rcv led flickering during incoming packets. Apparently, the Digi TNC, CD command was set to internal instead of software, covering up this symptom.

We couldn't hear anything wrong with the receive audio, so I looked at it on an 'O'scope and found a spike with a very wide trailing edge, occurring randomly, about 18db stronger than the background noise level.

Hooking up the TNC to an HT, with both on battery power, we shut down the 60cps power throughout the house, without affecting the interference.

While walking around the yard, looking for possible sources, we noticed a strong static build up on every piece of metal.

To digress slightly, the Digi is located on top of a sandhill, about 160 feet above the average terrain. The weather for the last week and a half has been clear, windy and abnormally low humidity (20 to 30% instead of our normal 70 to 90%).

Assuming the problem was due to static buildup, I did a hard reset on the TNC, then had no problem reprogramming it. Setting the system up normally, I found that occasionally, a packet would fall entirely between the spikes, resulting in good sensitivity and normal retransmission. When a spike occurred during a packet, it required an incoming signal of at least 6 bars on the receiver, before the packet was clean enough to be retransmitted.

During the night, it rained lightly and the problem went away.

At this point, I am assuming that the static was the entire problem, including the scrambled communication protocol. Has anyone else noticed the KPC-3 being sensitive to static, or was this a random event?

regards,
Joe kf4dys

I can make maps of anyplace in the world from the Digital Chart of the World
CD-ROM.  I will then put them up on the FTP sites..

I have made some of the Austrailian Maps and New Zealand too, they turn out
pretty good.. (This is of course Win/Mac Maps)

By  "listing or Longitude and Latitude co-ordinates world wide"

do you mean lat/lon of cities etc? If so, I have seen this and will go look
for it...  If you mean something else, please explain.

Rendered body type: text/plain

```
Hi again Richard !

Well, ahem, this is going to be from a Canadian perspective, and given
what the bands are these days, here's what I've been able to glean :

1) 10.151 LSB is the main place for APRS packet folks
2) 7.085 LSB appears rarely up here; mostly folks on the West Coast
   of the USA and sometime a few others when 30M is really dead.
3) 18.110 LSB I saw only a couple of stations on there one day,
  Mike KD4EMI and Peter W7LUS-14 (in the big rig), again, it was
  one of those days when 30M was darn near dead.
4) 7.0855 this was one chap on the West coast; dunno if he was
   trying for 7.085 and was just off frequency or not. The band
   dropped out before I could reach him.
5) 14.0963 thru 14.100 LSB there have been some experiments on 20M
within this range; my observations are that most folks will try for
an hour or so, and when they find themselves all alone, QSY back to
30M, grit their teeth and wait for the band to come back.

Also, bear in mind that I run the GATE here in the Toronto Ontario
area, and as such, my rig tends to stay on 10.151 LSB most of the
time; so all kinds of neat stuff could be happening on other bands
that I'm totally unaware of. I was hoping that someone would bring
up the topic on the SIG and I'm curious if any of your other replies
are similar to mine, above.
```

What would really make 20/17M popular is if we could get some of the
DX boys interested; G land leaps instantly to mind. So far, no luck.
We're sending a couple of APRS "ambassadors" armed with disks over there
in another few weeks with the hopes that we can raise some interest.
All it takes is for one or two stations to start playing with APRS,
and bang, it takes off like wild fire. Toronto is a good example, a
year an a half ago, we had maybe, 6 stations on the VHF side; now
my mailing list has over 120 stations (we mail bulletins, tips, etc
via packet) and we've got 8 digipeaters that reach from Buffalo N.Y.
all the way around Lake Ontario on to Peterborough in the North East
and Barrie to the North. (I see this morning, that Rochester N.Y.
are back on testing their digipeater). Like I said, interest is
growing like wild fire.

Sorry to ramble on, hope this helps, and until next time, vy 73 de John
VE3NEC.

Not static, Joe- but a really freaky problem nontheless. I have a KPC3 whose rx data sometimes flashes while the TX is sending data. Full duplex? nope. The radio is a stock GE MVP whose rx oscillator is unpowered when the TX is up. One of these days, I'll try another rig or TNC, but until then, I'll ponder about it.

Your static issue sounds familiar. The TNC on the Huntsville balloon a few weeks ago put out garbled data for the last 1/2 of the flight. I wonder if it was static glitched? It was usinf a zero pressure balloon which was like a plastic garbage bag instead of the latex type weather balloon we usually use.

I never heard from the guy in Huntsville (KE4ROC, I think) whose TNC it was as to whether it recovered or has to be reset/repaired.

Ralph Fowler
rwf@mindspring.com

Albert Einstein, explaining Radio:

"You see, wire telegraph is a kind of a very, very long cat. You pull his
tail in New York and his head meows in Los Angeles. Do you understand this?"
Einstein then continued: "Radio operates
exactly the same way---you send signals here, they receive them there. The
only difference is that there is no cat."- lifted from the ARRL Letter,
Electronic Edition.

Message-ID: <199610262348.TAA24488@grumpy.magg.net>
Rendered body type: text/plain

Not enough interest to support the expense for many of us on 2 full gateways runing 24hrs a day, it is also a big risk here in Lighting Country to leave an unattended station. Way I see it if my 30M radio get's smoked at least I have a radio to fall back on, if both are in operation and both get smoked it will probably be a few years till I can afford a new HF rig.

Another problem we found is that most people were disinterested in using the FLGATE. Everyone wanted to go out on 30M where the "action" was so even when the FLGATE was on 80M no one was on except for the FLGATES, everyone else (mostly) stayed using GATE.

At my last trip to the Sullivan NWS, I noties that every map that dealt with
winds used wind barbs. This is something to think about for a future release.

For the people that might not know what a wind barb is. This is a stick
showing wind direction by pointing into it and show the wind speed with
"flags" on the end at 5 mph inc.

I believe that the tests were to prove that 80M is a viable method to
connect Florida together. I believe that they might be used in an emergency
(ie hurricane) where FLGATE (or is GATEFL) would prove to be a more useful
than 30 meters.

Rendered body type: text/plain

For those that may be interested, I found this chart of graphics used on wx charts at a NWS site. You can view it by going to my site (you'll need to add the http://www. to make it work), I've purposely made the link broken so those without browsers won't be hurt by the binary file in their juno-style mailboxes. Probably not possible to create these symbols in DosAPRS (comment please Bob), but should be possible in Win/MACaprs (Keith/Mark ?).

Bill, This Bill K1TRS in Conn. I won't change what you are doing because of an other operator's activities. If what you are doing is enjoyable to you and of help to others...then continue. Amateur radio is becoming another area that people like to try and control and be the 'most important station' in thier area. This happened with the growth of FM repeaters and Packet Digis in almost every area. I see it to a small degree here in CT. Everyone wants to be a WIDE-RELAY. To see thier call with the Green Star ! It seems everyone wants to control somthing.

Amateur radio is a hobby that should provide enjoyment and should try to help others.

You know you are doing a good job and that your efforts are to help not hurt. Don't let the people who for one reason or another control your enjoyment of the hobby.

Subject: [APRSSIG:5857] Bye,Bye

I didn't think I would ever do this but I have decided to give up running
APRS altogether. I have for a long time now been doing some checking, and
this is not so easy task about where and how my signal is going and
through what digi etc. I had an idea that a certain indivitual was
Budlisting my call and am now convinced of that. After watching WA4DSY
internet server for a long time i noticed the call WA8INZ never shows on
that list. So testing again this morning with me 300W and my stacked
13B2's directed right at a digi that does show up in the list all the
time (By the way I see that digi direct) I never ever see my or my digi's

call show up on that list. When some users are sinking that low to budlist users because of a dissagreement between two people then i don't want anything to do with such a group. Therefore I will discontinue using APRS and will be removing my APRS webpage from the internet. Sorry there are a great bunch of people on both the sig and those running APRS, but budlisting users is uncalled for. I will leave the digi up and running in Huntsville since I won't sink to that persons level. It's been great while it lasted guys. I have been running APRS pretty near from it's start and have enjoyed it, but there are some people that just will never give up. I know I have upset people both here and while running APRS and i'm sure there are those that will be glad to see me dissapear, and some dislike the fact that I speak and put down in words what i feel and I had always thought this was a free country, but I guess there are those that think a dictatorship would be better. I know my letterwriting is not the best in the world and I don't realy have the skills to express myself to well but i'm sure most people got the drift on how I felt. 73 Bill WA8INZ

>etc....
>
>Bummer!!!! I'm vain as the next guy but even >I< get tired of seeing 8 or 9
>posits on the map all with MY callsign on them!

Seems to me this could be fixed by making the WX parsing a tad smarter. I ran into this bug, too, while I was running my WX station standalone. Only noticed it because I occasionally monitor the station from somewhere else. I've seen other WX stations show up with garbage in their stats, though I don't know if for the same reason. I think if the parsing doesn't yield numbers for each data group, APRS could assume the packet is not really WX data and ignore the "data".

>From my perspective, Bill/INZ, has been a major contributor to this SIG. Like others have mentioned, I don't always agree with Bill's comments, and think he's too quick on the draw at times, perhaps a reflection of a headstrong personality. I get that too at times. But at least he has something to contribute, and has regularly done that when others didn't have anything to say.

For some unknown reason, Bill has managed to PO the fellow who has locked him out of the digi, and thus loss of primary path. Bill, and other readers: I would find it a greater challenge to resolve that issue, and make whatever changes you need to make to get him to allow you digi privileges again. APRS didn't do it, the SIG didn't do it. YOU did it, so YOU fix it. Maybe you won't be able to resolve it, but that's no reason to give up APRS which has brought incredible interest to packet. In the meantime, keep the station running and the SIG alive with your input.

608. Bad operating example in KPC-3 Manual!

From: rwf@mindspring.com
Date: Sun, 27 Oct 1996 08:52:30 -0500
To: aprssig@tapr.org
Cc: support@kantronics.com
Message-ID: <3.0b19.32.19961027085225.006f22dc@mindspring.com>
Rendered body type: text/plain

```
An APRS user in another area (whom I correspond with via telephone) was
using a strange path a while ago.  When I realized this, I helped him
choose a better path and found that he got the bogus path straight out of
the KPC-3 manual!

I am looking at one of the newer manuals right now.  It has the GPS
supplement bound right into the manual.  I'm not sure if the old supplement
that was distributed by itself was also affected.

The example in my book is on page B8 in the sectionwhere the LTP (GPS
beacon path) is set.  The manual suggests using a path of :  APRS via
WIDE,RELAY,RELAY

A seasoned APRS user would see the problem of using RELAY as anything other
than the first entry, but this person was kind of new and didn't yet know
this.

I hope someone at Kantronics will see this and see that the manual gets
corrected next time around.  All the rest of us should help new KPC-3 users
make sure they know that the example is incorrect.

The last time someone ended his path in RELAY around here, it was a guy in
a plane beaconing very often! Talk about QRM. Heard him for hundreds of
mikes.  I almost got beheaded because of the QRM to the TV every minute
when the XYL was trying to watch a movie shed waited months to see.  (the
APRS and TV antennas are *very close* at my remote WX site).

I see the same thing with several WX stations in this state. Seems that the
U-II's are not set up correctly or are damaged, one or the other. I set a
lot of them with no data, just a wind direction and speed, and some with a
wind speed  that makes no sense, it is always showing 5 or 7 mph. Bob can
something be done abut this with the program ?

I'm sorry to hear that you are letting someone else determine your
actions, Bill.

Look at it this way. Someone who would put a digi callsign in his
Suppress list, will probably run out of room for all the people he
dislikes, since the list in the TNC is limited. As APRS continues to
grow, he'll find other people to be pissed at. Just ignore him
completely and he will eventually erase your call sign, to put someone
elses in there (someone more emotionally satisfying, in their response
to his petty action).

OK, I've stayed out of this one long enough without opening my mouth so watch out!!!

I do not know how you have dealt with the other APRS users in your area, Bill, but I DO know how you've dealt with your fellow SIG members over the past year or so!

You and I do not always agree on things and I suspect that this will continue to be the case, not only with me but with others also.

On many occasions you have posted very terse and angry commentary on this SIG. You have bashed others repeatedly out of anger or misunderstanding. I recall a particular bashing of N4NEQ (Ralph) in which you attacked him publicly about some crystals that you had apparently loaned to him.

Picking up your toys and going home mad is NOT the way to deal with the problems you are now having in your home area. Maybe it's time to make some public apologies then perhaps you would find yourself welcomed back onto the digipeater! I don't know if that would help or not but without hearing both sides of the story it's hard to determine who is at fault.

I do know that locking a packet user out of a digipeater/network is usually the absolute last resort when an operator either refuses to cooperate or work within the gentlemen's agreements that we all try to live by.

I ENCOURAGE you to make contact with the digipeater sysops and (nicely) ask for an explanation of the rationale for locking you out. I would also encourage you to work WITH those in your immediate area.

You DO make a positive contribution to the APRS SIG the majority of the time and I would hate to see you leave but if you are REALLY fed up, then that's probably the best thing you can do for yourself. I am just sorry to see all of your efforts with the web page and so forth go down the tubes and hope that you will consider trying to work things out in Alabama with your neighbors.

Good luck!

Rendered body type: text/plain

I have fixed the problem with Netscape 3.0 and Windows 95, although I don't know how. For the programming aware among you, the problem was that sometimes the program would give up on parsing a string that was valid, for no reason that I could determine. Adding a dummy assign to the program before where it would give up solved the problem. This error only

```
occurred under NS3/W95, not with Mac/NS3, or NS2/W95. It seems to be some
strange concurrency bug in the just-in-time Java compiler in NS3 for W95.
I've sent my comments to Netscape but haven't heard anything from them.

In any case, javAPRS 0.9b2 is up on the TAPR server, and all who have
javAPRS on their web pages should upgrade. Using version 0.8b(x) will
prevent NS3/W95 users from seeing any station that includes time info
(digis and stand-alone trackers/WX work fine).

615. 6M Frequency Proposal

From: n2czf@magg.net (Richard Garcia)
Date: Sat, 26 Oct 1996 21:22:00 -0400
To: aprssig@tapr.org
Cc: aprs-fl@tapr.org
Message-ID: <199610272123.QAA12802@grumpy.magg.net>
Rendered body type: text/plain

```
Ok nuff is enough,  some of us have spoken about 6M and today I saw a BLN on
my screen that someone was listening to 50.62, seems that the time has come
to get serious. Previously I posted a message RE: the 50.62 frequency choice
and how it has quite a few downfalls. For the past 2 or so months after
posting that message I have been listening to 51.68 and 51.18 in the SE
Florida area and have heard no activity at all.

This frequency pair is recomended by the ARRL Repeater Directory, I know I
know they are not the final word on frequency choices (I do not want to
start anything all over again) but it is was a place to start. I would like
anyone with 6M capability to listen to 51.680 and 51.180 and give me some
input on it from your area. I am prepairing to submit a request to get this
pair assigned as a an APRS frequency in the state of Florida and it would be
nice if we can all do the same as we have tried with 145.79. I know that CA
may be a problem since most EVERYTHING is tied up already but this is to be
expected.

BTW this pair is exactly that a pair suggested for a DIGITAL REPEATER. Why
in the world they would suggest that I have no idea, but we can just use the
output for regular digi's and if anyone has the inclination to build a
repeater then they have the input for their disposal. 51.180 is the Input
and 51.68 is the output I am suggesting 51.68 as the APRS frequency since it
is the closest suggestion to the normal FM Sub-Band for SWR considerations.

>hookup for Macs a couple days ago, and will probably try that this weekend.

The Mac cable configuration may be your key, Mel, though you obviously have the at least the GPS output wired right because otherwise you'd see nothing at all on the Newton. It is not necessary to use RS422 adapters, as all you have to do is use a specific TXD lead (I forget which one... "TXD-", I think) as the functional equivalent of RS232 TXD against data ground. While the 422 and 232 specs don't seem like they're compatible, Apple's implementation of 422 is little more than 232 with differential drivers.

I've had no trouble using both a GPS-45 and an old Magnavox 4200 with my Newtons. You might want to know that, to save energy, AppleTalk is not enabled on the Newton unless the application is specifically looking for AppleTalk services. So this means that any serial program you're using (TermLimit, maybe?) doesn't have to worry about running interference against AppleTalk protocols.

However, unless I'm mistaken the GPS-20 should cold-start without any external encouragement. My guess is that there is another problem, unrelated to your serial interface.

618. Map data from remote U2000

From: Geoff Peacock <geoff@maf.mobile.al.us>
Date: Sun, 27 Oct 1996 16:37:44 -0600 (CST)
To: aprssig@tapr.org
Message-ID: <Pine.SOL.3.91.961027163121.13945C-100000@ns1>
Rendered body type: text/plain

I have an Ultimeter 2000 set up remotely. What follows is an example of its packets. I get the blue dot but no wind direction indicator from the dot or any data on screen when it is selected with the (n), or when (W)x, (D)isplay, (T)emp (I think thats the sequence) options are turned on.

```
WB4QEV-3>APRS,K4ZM-1:!3031.31N/08807.31W_
WB4QEV-3>GPS:!!00590084030903B1----03D7--------012C04ED04070050
WB4QEV-3>GPS:!!00460093030903B1----03D7--------012C04EE04070046
```

Can you tell what I may have set wrong. Using PacComm Tiny 2

Thanks.

```

Even if wiring is correct, GPS 20 ignores commands that are incorrect.  Note
that the checksum shown in the documentation is not required, but the
asterisk, C/R, and L/F are all required, and in that order.

> Another question....does the packet mode of the 2000 work w/aprs or
> should I keep it in the gps mode ?

ANSWER:  THe U-2000 should be in data logging mode if used locally.  It
should also be in the data loggig mode if used remotely too.  This
requires a GPS capable TNC to do the timing of packets.  The U-2000 packet
mode should not be used...

APRSdos REPLY/COMMENT: Understood, but your beacon is your status packet.
It should be maintained up to date with your current intentions if
unerway.  THats where you tell folks your next port, ETA, fuel and water
status, etc....  Oh, at 1 packet every 15 minutes the cost is .3 % of 20
amps or about 60 ma average power.  Compared to probably 1500 ma just for
your receiver, its not worth turning off....in my opinion, hi hi

```
TIPS OF THE WEEK:  Use the alt-S-OTHER-ZONE command to change your UTC
offset back to standard time.  Then FILE-DOS to change  your PC time, then
alt-S-SAVE to make the change permanent (till spring).

APRS TIDBIT.  Ever wonder why BK files from other people load up with
no one faded to gray, while yours are?

Simple, if you load a backup file with your call as the first station,
then APRS knows you saved the file and therefore it preserves the oldness
of old packets.  If, however, you load a file that was saved by someone
else, then APRS always sets CONTROLS-FILTERS-FADE to OFF because of course
the file is old and no one wants to see everyone faded....

Oh, if you turn FADE off, tho it will revert to ON again after 2 hours...

Just thought you'd like to know...

Hi all, I am very new to APRS but starting to enjoy my somewhat limited time.
I am running DOS version of 7.7b and really like it.
I've seen some information that a user (like me) should not have WIDE in
his unproto path.  I'm using W0BXR-8,WIDE.  Should I be using some
```

640. WinAPRS 1.1.6 and HSP

From: Mark Sproul <sproul@ap.org>
Date: Mon, 28 Oct 1996 11:05:46 -0500
To: aprssig@tapr.org
Message-ID: <v03007800ae9a89aefedc@[165.1.27.171]>
Rendered body type: text/plain

```
I have HSP finished for WinAPRS.

There is a new DLL, Serial32.dll.  This is required for proper operation.
Note: I do NOT have the new DLL finished for Windows 3.1, so HSP will not
work on Win 3.1 yet.  When I finsh the 16 bit DLL, you will simply need to
download the new DLL and it will work.

        ftp://aprs.rutgers.edu/pub/hamradio/aprs/WinAPRS/

        ftp://ftp.tapr.org/tapr/SIG/aprssig/files/winstuff/WinAPRS/

Also support for the Agrello DFjr is now working properly.
```

FYI,

This information also appears in the upgrade manual as Ralph had
suspected. I noticed it too just the other day when reviewing it as I
just picked up the upgrade kit for an older KPC-3 which had the ver 5
firmware in it.

Since Jim has forwarded a copy of the msg to KAntronics I see no need
for this msg to any further, just thought I'd bring it to everyone's
attention so if they were elmering a new user who had performed the
upgrade they would be aware.

Rendered body type: text/plain

Why do we have to make the software smarter? Why can't we educate the
operator? That way other areas WITHOUT these problems are not shackled
by the operator limitations of another area, and everyone moves towards
becoming a better operator (or packet control op in this case).

Is it correct to assume that this is "required" for proper operation ONLY
if you are going to use the HSP function? Otherwise, those of us not
involved with HSP could wait for the next release?

APRSdos REPLY/COMMENT: For reliable reporting of moving position reports
back to home base, 10 meters is useless. BUT it would be a great band for
DX where APRS QUICKLY plots band openings! I dont remember, but cant we
operate at 1200 baud there?

Yes, but it's virtually useless due to multi-path and phasing distortion. Any ionospheric reflection appears to cause some real severe distortion that 1200 baud doesn't like. 1200 baud works on 10m, "kinda"...but not very well. Throughput is faster at 300 baud due to all the retries.

Listen to 10m fm and all the distortion on it as the sig fades in and out, even when quite strong, there is so much distortion that the packets just can't cut it. So I wouldn't put much hope for 1200 baud.

John:

Are the VHF digis in Buffalo and Rochester operating on 145.79 or another freq? I recall there was a problem in coordinating APRS activity on .79 in that part of upstate NY.

Yes, the new DLL is for HSP operation only, the old DLL will work with the new software.

Version 1.1.6 also supports GPS input from the PicoPacket.

APRSdos REPLY/COMMENT: I agree that 10mFM has terrible phase distortion,
but I assumed that was due to the wide bandwidth of 12 KHz. I just
assumed that operating FSK at 1200 baud is only a 1K shift so the
distortion would be about 8% of what you hear on FM. But that my too
still be too much to work...

Other than the band being nearly dead, I can't think of any.. You can get
low power 10m rigs downright cheap. Power isn't a real consideration on
10m anyway except for ground wave; if the band is up, 5W works everywhere.

May I suggest using 28.2777 MHz? (That's 28.APRS using phone -> number
conversion.) As I recall, most digital work on the Novice section
centered around 28.15 -> 28.20 MHz, with the upper part nearly dead.

In its present state, maybe so. However, keep in mind that groundwave
propogation of 10m is similar to that of 2m. A few well-placed WIDEs
would take care of that problem.

Yes 1200 baud operation is allowed on 10m, but it won't always be physically
possible.  Nasty things like intersymbol interference tends to limit digital
data transmission rates on HF and digital bandwidth.  The signal processor
wetware between the ears takes care of voice signals.  However, since most 10m
HF ionospheric paths will be single mode, 1200 baud will work a good deal of
time when the band is open, like in 2-3 years.  Sunspot mimimum will occur
about American Thanksgiving.
    Another point.....with the KAM you cannot push 1200 baud signals out of
the "HF" port.  This is for good reason as Kantronics has optimized the HF
port for 300 baud or less and the VHF port for 1200 baud.  You will have to
switch cables or build a switch.
    You can use either port with with the MJF-1278.  They change filter
bandwidths in the analog section with a switched capicitor filter.
     I can't tell you first thing about the AEA tnc's.

Why wait, Try the space mode of Bob's dosAPRS late at night
with the MIR on 145.550 MHZ. One or two quick packets in the manual
mode will not add any QRM. Last I looked the digi was on.

A Discone with 45 watts can connect to Shuttle packet.

Maps  MISTERY STILL not resolved....
I have locally  visited and tried from Municipalities and also from a
Military Organization to obtain any kind of digital Maps for Ecuador...and
nothing  gained...
A while back a friend on this system offered to make some maps and I sent a
large TUBE containing  MAPS local regional and National
( typical geographical large  scale Maps) and after  several months
the TUbe returned undeliverable  MAIL...so failed..will keep trying...
I see the  present  msg and perhaps if there is   world CD-rom with
info any scale  Map will be great for me to work with...I sit here
looking ad when I travel there is no detail Maps at all of my
trips and efforts and can demo to tohers  Hams  either...
What  is needed  to ask for   someone to provide and what shall i provide
for  data to obtain some course  Maps even...on this region of the world...???
basic  areas are within  about
02 00 00 north
04 00 00 south
80 00 00 west
76 00 00  east

Still reading   10.151 data and  propagation  very  extrange at cerain days
and  times.... but all great  info and learning
has increased a lot.

Thanks for  help and info required  I shall make any  effort  ti
supply.

~ Ontario APRS Support Page ~
                    -------------------------------

For the past few months, we have been working feverishly to update our
Ontario APRS support page.  Initially established in mid 1995, we have
grown to become a popular stop-off to APRS surfers on the Internet.

Today, we are pleased to announce some major feature additions to our
website. Some of our major features are:

o javAPRS: For the past two months, we have been working with
Steve Dimse (K04HD) to identify some browser specific issues in his
```

javAPRS work. Steve has identified these issues and we are now ready
to make our javAPRS site public. Running with a dedicated transceiver
on 144.390MHz. (Canadian APRS frequency), we are providing real time
javAPRS updates from 15 minutes to 24 hours of activity - automatically!

o Guest Book: Many of our guests to the system are experts in APRS and
other associated activities. With our guest book feature, all users are
able to review previous connections and determine who might be a
knowledgeable candidate to assist with your problems. All guests are
encouraged to sign into the guestbook.

o Online Conference System: Another exclusive feature to our system is
the online conference system where guests can connect to a bulletin
board style message system. Visitors can leave messages dealing with
APRS, buy & sell messages, or just general chit-chat. All of this is
done with your standard web browser.

o Latest Updates: As with most other APRS pages, we always maintain
the latest APRS software versions, along with being the Ontario APRS
map distribution site.

We think we have a site that you would enjoy visiting, and maybe
even gain some knowledge while you are at it. Please take a few
minutes and visit our site at:

          http://www.peel.com/aprs

Thanks... John VE3SVE - john.kerr@peel.com

I use to run a lot of 1200 packet on 10 when the band was in good shape.
Seems like the freq for 1200 baud was around 28.105 thru 108.

676. Dual 2 Meter devices on one antenna

From: kr4ol@juno.com
Date: Tue, 29 Oct 1996 10:25:36 PST
To: aprssig@tapr.org
Message-ID: <19961029.102541.24039.1.KR4OL@juno.com>
Rendered body type: text/plain

Ok, Thanks Larry for prodding me on this one. I promised to send
this message regarding how we are using one transmitter, one feedline,
and one antenna to serve APRS on 145.790 Mhz. and our Node/BBS on
145.070 Mhz. simultaneously. I'm afraid you may be much more qualified
as an electronic technician than I, so you will have much better
understanding of the minute details of this. I will explain as best I
can how we accomplished this, and you may have to interpolate some of
the details.

        Lets start at the T/R switch.......we installed an external T/R
switch, put a "tee" on the receive side, sending the leads to two
separate receivers. One receiver is on 145.790 Mhz., the other is on
145.070 Mhz. Each of these receivers sends receive audio to its own TNC.
I am using Kantronics TNC's, so when the TNC calls for transmit, it does
so by showing ground potential to the rigs' PTT. It just so happens that
in a crystal radio, channel selection is made by grounding the crystal of
the channel to be used. So, the TNC has the ability to "choose" channels
in the radio at the same time it calls for PTT.So, as each TNC calls for
transmit, it automatically chooses the correct channel in the
transmitter, and keys the rig. That is how a single transmitter can
serve the two frequencies. There are some other important details that
must be addressed. We set TXDelay to 50 to allow the TNC plenty of time
to switch channels and get the rig keyed. The data-out from the two
TNC's are tied together to the mic. input of the Rig. Pin 2 on
Kantronics TNC, when shown ground potential, show a "busy" on the TNC,
so it cannot transmit. We hooked Pin 2 on each TNC to the PTT of the
other, so when one TNC is transmitting it shows "busy" on the other.
This avoids internal collisions.

        When we first started talking about this, it sounded real good
in theory, but we wondered how it would actually behave in "field
conditions". Well, its been up & running now for a couple of weeks and
so far it has ecceeded our expectations. Each side is apparently
transparent to the other, there have been very few "misses", and unless
the process is explained, users never know the transmitter is serving

two masters. Each TNC has the capability to "hold" a valid packet frame
for transmit until the "busy" condition ceases, then calls for transmit.
I am sure that there will be the odd frame that will be missed due to the
receiver not being available at the time, but in watching it over the
past few weeks, it appears to be very few.

Well, basically, thats it! cat's out of the bag. This technique has allowed us to add APRS to our existing Node/BBS without having to add
another transmitter, feedline, and antenna. With our transmit antenna
400' up the tower, this makes our Digi very advantageous to the network.
(we hope)...........

677. DIGIpeats

From: JohnLGaf@gnn.com (John L. Gafford)
Date: Tue, 29 Oct 1996 08:53:56
To: aprssig@tapr.org
Message-ID: <199610291454.JAA01383@mail-e2b.gnn.com>
Rendered body type: text/plain

I am centrally located in Texas (Waco, half way between
Dallas-FtWorth and Austin). When I first started using APRS I had
no problem getting digis back. I can see stations from DFW to
Houston, but xa gives me the message, "APRS did not see a DIGIpeat
of your last packet...". I am using UNPROTO of RELAY,WIDE,WIDE.
Even when N5PAY-3 (a wide area digi in Temple - about 30 miles
south of Waco) is on the air, I still get the "APRS did not see"
message. What has possibly changed, or what am I doing wrong? At
one time I could send and receive messages to Granbury, Temple and
Austin. Occasionally, xa results in a response, but it is rare and
intermittent. I am using DOSAPRS 77d, and have tried earlier
versions with the same results. Any suggestions will be sincerely
appreciated.

John - N5XAK

```
Dear Mark:

When operating both HF and VHF (dual port) on DSP 2232 I do not get
both VHF and HF indications of received packets.  Both the VHF and HF
show up as VHF, just wonder if anyone else is having this same problem.

Thanks.

Well, the difference between the ports on the DSP-232 is that the VHF port
can do 9600.

I'd suggest 28.2xx for APRS.  The 28.1xx freqs are full of keyboarders
when the band is up.

APRSdos REPLY/COMMENT:  He cant get a radio that will tune both the high
end and the low end of the band simultaneously.  In my opinion, that is
what makes 50.62 so good.  Nobody with a voice radio is going to bother
with it, so if you xtal up an old low band radio and dedicate it to APRS,
then you have no problems...

John,it sounds like your closest neighbor changed the MYAlias in their
tnc away from the default of relay.you may need to get more digi
specific in your unproto path to see the digipeat.i dont know how far
away n5pay-3 is from you, but you could try Unproto N5PAY-3,wide,wide.
In SFlorida,I use about 3 very digi specific paths to get out,
via WA4HXZ-3,KF4DXY-1,KD4EMI-3,this gets the path south into Miami.
via WA4HXZ-3 for keyboarding with friends
via wide,wide,wide for general coverage in our area(where everyone is a
wide hihi).John I hope this helps..73

685. ARPS PICO w/2port settings?

From: "Kent Hufford" <khufford@erols.com>
Date: Tue, 29 Oct 1996 12:31:01 -0500
To: <aprssig@tapr.org>
Message-ID: <199610291726.MAA05132@smtp1.erols.com>
Rendered body type: text/plain

Could some expert (or non-expert) please give me to correct settings for
the Paccom PICO TNC w/2nd port that is used with APRS 7.7d, GArmin 45?

A dump the internal settings of the PICO would be great. Or what are the
settings required in APRS (dos or WIN).

This APRS stuff sure is fun... once the settings are right. But, maybe it
is the quest for the right ones that is fun. Dont know.

thanks in advance

Excellent use for an old PK 232 but you might let us know what is required
in the way of chips to accomodate APRS. Also, I believe one must be above
29 MHz to use 1200 baud. Cliff K7RR

687. W3IWI-13 DGPS

From: clark@tomcat.gsfc.nasa.gov (Tom Clark -- W3IWI)
Date: Tue, 29 Oct 96 19:01:05 UTC
To: aprssig@tapr.org
Message-ID: <2368@tomcat.gsfc.nasa.gov>
Rendered body type: text/plain

Today I made a minor change on the W3IWI-13 DGPS beacon to provide better coverage, especially into the Chesapeake Bay. Formerly the beacon was sending its <UI> frames W3IWI-13>WIDE where the main WIDE I see is WB4APR-1 in Annapolis. I changed it to W3IWI-13>WIDE>WIDE so that there was a better chance of hitting the PAX RIVER digi, as well as providing better coverage to the north into PA/SNJ.

In case you start seeing heiroglyphics on the screen, never fear! They are intentional. They come at the rate of one beacon per 20 seconds to give a good chance that a DGPS user will get two corrections within the one minute "aging" period common to most GPS receivers. The DGPS data strings are all under ~60 characters long, and all the characters are printable (even though they are illegible to mere mortal humans!).

As I reported before, the DGPS bits are generated by a professional (Trimble 4000SSE) GPS receiver connected to the same GPS antenna used for my IGS (International GPS Service for Geodynamics) site called GODE. The amateur interface begins at the RS232 connector and consists of a personal PK232, IC-27 and 6 dB gain "stick" on a ~30' tower next to the GODE site.

I am anxious to get reports, both on the W3IWI-13 coverage area and from people who use the DGPS signals with their GPS receiver. Out to a couple of hundred km from the Greenbelt MD area, the DGPS signals should help improve the accuracy of your handheld GPS receiver to the <10 meter level, removing the effects of the DoD's Selective Availability (SA) dithering. Also the accuracy of your velocity determinations will improve -- no longer will your GPS receiver say you are moving 1-2 MPH when you are fixed.
If your GPS receiver says it is "DGPS Ready", all you should have to do is to poke the 4800 baud data stream from your TNC into the GPS's RXD data input connection (and perhaps tell the receiver to accept DGPS inputs); the heiroglyphics in the DGPS beacon are formatted the same as the bits coming from commercial ~300 kHz or FM subcarrier DGPS receivers.

I believe WB4APR still has "hooks" in APRS (they were there eons ago) to pass the DGPS bits from the TNC into your GPS receiver. I haven't had the chance to test this with a recent APRS 7.x release. Can Bob or somebody report if it still works, and perhaps post a note on how to configure APRS to make it happen?

The lower limit for 1200 is 28 Mhz, according to my FCC rules.. hence the activity 28.105 & up.

As far as APRS is concerned, unless you are going to use the PK232 as a tracker (WHY???????), there isn't anything special required. I have an ancient one with 1988 proms, and it works great.

I don't think AEA supports GPS in any PK232 firmware release.

Doug

Rendered body type: text/plain

```
Several responses to someones question about 10M APRS freq.
WB4LTF said between 28.105 to 108
KB4OAM said         28.195
N3EOP suggested     28.2777 (28.APRS)

I liked the last one due to its memorability, but then I also hate
lettered phone numbers because you have to "convert" them to use them...

One that I can certainly remember would be 28.151 LSB ( like 10.151 LSB)

PROBLEM:  We need an HF TNC survey!  We must choose frequencies that
coincide with even 1 KHz so that commercial radios can tune in the signals
with standard TNC's.  They CANNOT RIT...  The current 10.151 was defined
by my old KAM which uses 1700 Hz center tones.  Many new TNCs use 2125 HZ
center tones.  Note that this is a 425 HZ difference that even the Navy
radios with 100 Hz switches cannot hit within 25 HZ.

Of everyone on 10.151 we need a comprehensive survey of who is using 1700
HZ tones and who is using 2125 tones.  If its 50/50 then there is no
reason to standardize.  If it is 10% and 90% then we need to do
something...  WHO on HF can start beaconing a bulletin and requesting
everyone to tell them their tones?  Rather than making them THINK, simply
ask everyone to "report their dial frequency" we can infer their tones
from that...

WHo will volunteer to do this? W3ADO PC monitor is burned up.  Its on the
air, but I cant see the screen without a lot of hassle, or I would...

Yes it  would be possible to make maps with only politcal boundaries, but one
would have to hack on the makmap code......it is a relatively easy hack...just
a simple software change....har!   The alternative is to make a minimum
feature map from the 1:2,000,000 CD and them delete eveything but boundaries
with mapfix.

Re: boundaries on 100K CD  They ain't there!   This CD was release without
that data.  The manaula says it should be there but I guess they ran out of
room.   You can get the 100K political boundary data from the USGS ftp site.
However a hack would be required in this case as mk100kv3 and earlier versions
ignore any typoe on data not found on the CD.

I understand that a mobile station transmits frequently (once every 1-5
minutes) at least compared to a fixed station (once an hour).  Is it
expected practice that when a mobile APRS station (vehicle) "parks" for the
night that it should turned itself off and stop beaconing?

   In other words, I would like to be able to set my APRS vechicle to 5
minute beacons and keep it on 24 hours a day.  Is this bad practice or
acceptable?

   Just trying to be a good APRS neighbor.

I don't have answer to your question, but since you have a pico from
Paccomm I thought I would ask how you like it so far.  Seems like the APRS
SIG likes the KPC-3.  I was thinking of the Pico with a built in GPS since
it is nice and small and has a few other features.

Since it is expensive $600 before I purchase it, I thought I would ask how
you like it so far?

-- [From: Kevin Kelly * EMC.Ver #3.1] --

Greetings SIG:

The N6QAB repeater is now fully functional as both a voice machine, and an APRS repeater NODE. The frequency is 145.130 minus PL 156.7 (voice), no PL required for Data on the input.

The machine consists of a Midland LMR commercial receiver, exciter, power amp, and a CAT 300DX controller. The Rptr receiver antenna is a Diamond 500XNA dual band antenna @ 90 ft, with the tx antenna located @ 80 ft. The receiver has an inline pre amp installed which gives it .14uV @12dB SINAD sensitivity.

The APRS Rptr NODE taps off the high side of the receiver volume control and is fed to the rx audio pin of port 2 on a KPC-4. Port 1 is connected to a dedicated GE custom MVP on 145.790. The MVP uses an 11 element beam @ 70 ft pointing North to WB4APR-1 for both tx and rx. As luck would have it, the W3PQT-1 Digi is 1 mile away directly off the back end of the beam.

```
MYA = WIDE/WIDE    (PORT 1/PORT 2)
MYG = RELAY
UNPROTO = W3PQT-1,WIDE
```

At the moment no PL is required for APRS "Data" on the NODE input. In the near future, one of the two planned remote sites will be coming online. Due to the nature of the remote installation, PL may be required. Limited testing of APRS "data" transmissions with PL on the input have not degraded the NODE's operation. More experimentation will take place later, once the voter is added to the system.

If you plan on being in the southern Md. area, whether by auto, boat, or plane, bring your APRS gear and MIC-E because we are APRS friendly!

73,
Kevin Kelly/N6QAB

Ralph

Saw a message with your title on it.

We are trying to get som ATV activity in Charleston, SC.

Can you point me to some information on rebiasing the finals on a comercial 440 MHz FM transceiver to operate on AM??

Would like to use PA from commercial FM rig.

Had a very interesting morning. At 06:30 PST. I had a total of 17 states on screen on APRS. Thats the highest I've seen to date. Curious as to "who" is the Maritime Mobil "YP694"..? had a couple of solid hits directly on 30m. Tried a few "one liners", but got no "ACK's" back. May have been stand-alone.

>
```

Sorry....don't have all the lingo down....thought what I sent would be of some help. I assume P-LIST is P from the main menu...if not how about a more detailed explanation of what you want and how to get there so I don't have to read the whole readme directory. P from the main menu says it is positions and not P-LIST however, so this may all be in vain. As follows:

P from main menu gives my position and

```
WB4QEV-3 291849 !******/3031.31N/08807.31W_
```

and nothing else

V from the main menu gives

```
WB4QEV-3>APRS,K4ZM-1:!3031.31N/08807.31W_
WB4QEV-3>GPS:!!0000008802E003B1----03CE--------012E055200000000
```

BTW nothing shows up on WinAPRS (which I assume you have nothing to do with) either which makes me beleive the problem is on my end.

You are right on, there Bob.  Low band Mitrek radios are coming on the
surplus market for $40 or less, and if you belong to a club that can get
a donation, or can pick up a pallette of them, for a lot less.  They are
(relatively) small, and can be xtaled for about $25 per radio.

I would be interested in knowing the nature and extent of the hack myself.
I also eventually need to produce some maps for skywarn use, and they need
to resemble what the NWS uses on their radar screens, which is normally
county line maps, also occasionally river & watershed boundary maps.
I already downloaded some of the USGS data, and discovered that the
routine couldn't input it.  To me, it would appear that the downloadable
input would be preferable to the CD, which could get outdated and costs a
few $$.

My monitor for the desk top is in the shop being fixed. I picked up an EGA
RGB color monitor to use with my Zenith Data Systems M/N ZWL-184-97 Laptop
computer. Several programs in the Laptop such as packet programs are
working great in color but the APRS program only runs in Black and White
with the EGA monitor. My question is, will APRS work in color using an EGA
system and if it does is there something in the APRS software that I am over
looking. Any help or comments will be greatly appreciated.

711. Re: [APRSSIG:5954] ARPS PICO w/2port settings?

From: aprs@juno.com (ap rs)
Date: Wed, 30 Oct 1996 01:46:24 EST
To: aprssig@tapr.org
Message-ID: <19961030.004432.9486.5.aprs@juno.com>
Rendered body type: text/plain

Here's what I use:

LGE $05   (very important!)

LOC EV 40   (for when the computer is off)

LPATH APRS VIA RELAY,WIDE   (or whatever path you want- used ONLY when
computer is off and Pico is in auto-tracker mode)

GPSTEXT $GPRMC   (set to the one sentence you wish to send- the Pico
only supports one right now)

APRS sets the rest, just tell it you have a TNC2
I don't set ELOC, APRS works fine without it for me

One thing: The Pico doesn't seem to be able to take quick, multiple
commands at 9600 bps, so I set the baud rate of APRS and the Pico at
1200. Bob supposedly added delays, but I can't tell it.

I have suggesed to both Paccomm and Kantronics that the GPS firmware have
a selectable "speed up or slow down function" that will speed up the
posrate if the fix appears to be changing (more thannormal SA) and will
slow down when it seems stopped.

The fast and slow limits would be user settable.

I also asked Bob to look at something like this in the live APRS program,
too but I think he forgot about it. It was a year ago.

Paccomm was very receptive to my suggestion, Kantronics didn't seem to
care much.

Good Question! I'd suggest setting the mobile up to come on when the
vehicle is started and shut down when you turn it off. If you want to
track the vehicle the instant that it is started, then you'll need to
keep the gps running all the time. (Most gps's have a delay in satelite
aquiring, some up to 15 mins!) However, if you were using the system to
track emergency vehicles, I'd suggest leaving it on all the time! If you
left it on all the time, though, it would beacon every time, thus
creating much un-needed traffic.

Bob, or anybody, is there a way to set this up so that no packets are
transmitted unless the vehicle is travelling? Or is that already in there?

EGA works with no problem. I've had two of them working until the first
monitor gave up of old age! I'm still using the 2nd with a 286... the 286
is slow but EGA definitely works.

The MIC-Encoder has a 3/4 turn potentiometer on the front panel which
allows the posrate to be slowed by various factors, 1:2, 1:3, ... 1:8.
So you could have posits sent every 10 minutes as the base time and then
extend that up to 80 minutes. You need not even use its MIC-Encoder
features, simply let it send the packets automatically (set the "auto"
time).

The MIC-E is currently (or will be soon) in Beta test through TAPR.
Commercial versions (and quantity purchases) will be available through
PacComm.

KB6LFM here.

I've wired my APRS system so the GPS (Garmin-45) and TNC (KPC-3) are
"ON" at all times, and the "Rig" comes on and off with the Ignition.

> "ON" at all times, and the "Rig" comes on and off with the Ignition.This seemed like a good place top
ask this:

I am interested in APRS and have a Garnin 55 GPS that I utilize for flying.
I have a KPC-3 that I use for mobile and updated the prom last year tro support GPS operation.

My question is what software is reccomended. I downloaded several softwares last night including one for
 dos
and one for windows. My new laptop has win95.

This SIG seems to be very active and that is great.

If there is a setup FAQ for my configuration that would be great too.

Thanks,

Download the W116UPDT.ZIP, this contains the application and the ZIP files
without the MAPS etc.  This is the best way to get the DLLs

I am copying most of your DGPS beacons here in the Philadelphia area,
via the WIDE digis N2CHV-3 and W3PHL-3.    I haven't used the
corrections with my Garmin 45 yet, but hope to try this later in the
week.  If I connect the RX data from the TNC (KPC-3) directly to the
Garmin, will the Garmin automatically filter out non-DGPS data, or will
this cause errors?

A question for WB4APR:  My "Heard" log shows less than ten packets per
hour from W3IWI-13, although I am actually receiving over 100 per hour.
What happens in the log if the number received from a particular station
exceeds 99?

Good question. Part of the answer depends on how much activity is in your area
and how far your position beacons propagate. There are not many mobile users
in my area and generally I leave mine on when I am driving around town and
only turn it off when i get home at night. Others in town leave theirs on all
of the time.

I have always wanted to to build a circuit to allow packets when the ignition
is on and to drop to a timing mode when the ignition is off. I set the TNC to
beacon a position every minute. When I park the timer kicks in. In 5 minutes
the timer stops allowing transmissions for 30 minutes then allows them for 5
minutes then stops allowing transmissions for 30 minutes. This sequence goes
on until the car is turned on again. A switch could be added to over-ride the
timer. The transmission interrupt could be cutting power to the transmitter or
simply interrupting the PTT or Audio Out lines from the TNC. My original
thought was just to cut power to the transmitter but since I started using
older synthesized rigs that lose their memory when you cut the power I have
decided the "open PTT" is the better method. Some day I will sit down and do
it. Maybe if I wait long enough someone with less patience will design one
first.

>    I understand that a mobile station transmits frequently (once

There are a couple of Simtel archive sites that have ham radio mods, and a
few of the mods are for GE/Motorola equipment.  If you have any specific
questions I can probably answer them, especially for Micor, Maxar, Moxy,
```

Mitrek, Mastr II, and other radios of that era.

I'm not on this mailing list -- your message was forwarded to me by Mark
N2CHV, so please respond via email. Thanks.

The problem is that the 30m users aren't necessarily an accurate sample of who would be on 10m. Aside from the licensing issue, there are a lot more of the 25w class 10m single band rigs out there.

As for my 28.APRS suggestion.. what I had in mind is that new users, with a standard 1200 baud (VHF-FM) TNC could tune to 28.2777 and be quite close to the signal.

Well, I don't have the same rig, (I use a Motorola GPS & PACCOMM
Handipacket) but I do exactly what you're suggesting. It works for me.

>A question for WB4APR:  My "Heard" log shows less than ten packets per

That's good news.  Shows that W3IWI's transmission interval is
about right since you're still getting about 2 corrections a minute
even with all those bounces through WIDE,WIDE which should be
enough to keep your GPS locked on differential, and the freq
still not clobbered.

With the PK-12 you can ground one of the RS232 pins and that will
trigger a transmit.  At least I think you ground it; the manual
isn't in front of me.  So, check if your TNC can do that then interface
your circuit to that.

  (Note: the 24Meg freq may be in error, someone correct me if so)
===========================================================================
The low bands will provide more activity and longer distances to the other
station. While a VHF TNC works at 1200 bauds, on the Low Bands, you will need
a TNC that will operate at a 300 baud rate. Several are available. Ideally,
you should opt for a TNC that will allow for simultaneous operation (GATEWAY)
on the low ands and also the VHF band. This allows you to link (GATE) the HF
data from the HF band, down to the VHF side. To see the newmerous HF out of
state APRS stations on your local VHF network band. (VHF 145.79/14501 & few
others.)
   Please read the HF.TXT file in the programs README.DIR. This will enlighten
many on the HF to VHF only use of GATEWAY stations and GATE paths.
   QSO among yourselves on testing the SUGGESTED frequencies, let the rest of
us know. Am willing to help, need date,time (GMT) and freq and will give it a
go OM..
    73's & Enjoy, Bill/WB6LPG SanFran Bay Area 30M reliable GATEWAY station,
on daily.. See Feb issue P45 of Cruising World for APRS for Yachting Hams.
Off mexico more S/V appearing, QSO and encourage the Yachting World about APRS.

Or maybe it would be a good opportunity to show how well packet (both
APRS and
even a plain old heard list) works as an indicator of band openings...
Packet
certainly isn't a weak signal mode but it does had some nice
advantages...

Using up 25% of the Novice/Tech allocation for beacons might not be a
great idea when a couple packet channels (with CW id's) could provide
about the same
functionality and more.

Nice work John...a couple of comments.

I don't know what connection you have with the internet, but the files
seem to come across pretty slowly, less than 500 bytes/sec, even early in
the morning. Probably nothing you can do abt it though.

How about adding a USA map to the maplist? I'd be nice to see if anything
is coming thru the local gate.
```

There is a feature that I don't think I had documented that might be of interest to you.

<param name="fileReload1" value="900"> would cause datafile1 to get reloaded every 900 seconds (15 minutes). The best way to use this is to reload the 15 minute file every 15 minutes, and then load the long duration file specific for the html file. They'll be dups received for the last 15 minutes, but the advantage would be continued updates.

Steve KO4HD

I don't know if Jack has delved very deeply into the 100K "Boundaries" files, but I've been playing with them for a couple of months trying to get consistent results with MacDLG. In short, I can't. At least not yet.

It appears that the Boundaries dataset relies a lot on "area" datatypes rather than the "line" types we're using. Also, there are a number of line records that don't have any line type attributes that have political boundary significance. It's been somewhat frustrating because every time I think "I've got it!", something else breaks the scheme. If I just let all untyped line records result in vectors, the output contains a bunch of extraneous lines such as quadrant boundaries.

So... as far as the 100K data goes, that's a long way around to say "we're still working on it".

How widely separated in time are these packets.  The first one is the WX
stationi BText shoing position only.  You will NOT see any WX data until
the next WX packet comes in.  At that point, the entry on the P-LIST
(positions screen) should include not only the position but should have
the WX data added on the end.

As sson as the next BText posit comes in, though, it overwrites the WX
data until it comes in again...

> could be switched manually or wired to the ignition.  How about it?

APRSdos REPLY/COMMENT: Gwyn, this would be atrivial software mod to your
TNC's.  WHen in GPS mode, use the DSR data set ready INPUT to the TNC to
toggle between HIGH rate and low.  If this option is selected in the TNC
menu, then when DSR is held high (by the ignition switch) then the rate is
normal.  When DSR goes low, then the rate is multiplied by 4...  Or
actually by N.   I would make the new TNC command be RATE N.  Where N=0
means the feature is disabled (default) and when N is non zero, then it
works!

APRSdos REPLY/COMMENT:  You may have an EGA monitor, but that system must
be working in CGA mode.  APRS will work with EGA, but in CGA mode it
reverts to B/W since that is all that is available in HI-RES mode...  Your
laptop is clearly a CGA video system.

> I also asked Bob to look at something like this in the live APRS program,

APRSdos REPLY/COMMENT:  APRS has always had this feature.  If your GPS
position does not change, then APRS decays the posit.  But with the
effects of selective availablility making even a fixed station appear to
move, this doesnt help.  ALso it means you have to leave the LAPTOP on in
the carr all the time if you want APRS do do anything...

>has come, and we shall all see how this european frequency change
>works..

I wouldn't sweat it too much. I doubt they will be able to tolerate it
for long, as it will QRM MIR far more than us. Imagine listening to all
the APRS LANs in the country at once, with doppler shift they will be
hearing us only 7khz away from their center freq as they approach each
lan. When listening for voice on 145.2 they will be hearing all those
unattended packet stations.

>From the perspective of the APRS user, the situation looks much better.
There will be 4 or 5 passes a day for most stations, 10 or 15 min each,
with "bad" doppler shifts for less than half of each pass. The station
will only be transmitting intermittantly during that time. Few of us will
ever notice anything.

My advice is just to ignore the problem, and it will probably go away.

Both packets were within a few minutes of each other, the beacon coming
first and painting the blue dot.  The actual wx data never shows in the
position list. It is never appended to the beacon text.

Folks :

John VE3SVE has taken one very large step forward for those of us
up here in the Great White North, and (pardon the pun) done a very
F.B. job of putting "these few acres of snow" on the map !

Take a deep bow, John, you certainly deserve it ! Fine job, well done.

For those of you that would like to see what we're up to, up here;
or indeed to see if you're being heard in Canada; try WWW.PEEL.COM
push the APRS button and go from there. (Bob, you can now see why
I don't really want the RMC string from the eyes of the law; hi,
```

now they don't even need to run APRS to nail me !)

John, when you read this, be kind, and remember, your Father's pension and my continued salery, pend on you not really disclosing how you get into the Internet. (Ahem) We are working on a box in my shop that will give you DS-1 (1.544 M/sec) over regular copper pairs ... this will only come to light if some of us continue to have our jobs ... so don't poke the parent company .... hi hi hi ! (You guessed it, folks, we're telephone people .... SVE does his thing with R.F. as I do mine with fiber.)

And to Steve KO4HD, also tremedous congratters; and I "kinda" agree that the U.S. map should be included in the list. (I gate the signals thru to the 2M network in our area.) However, (ahem) the addition of the U.S. map should not be at the loss of "important" maps ... cough, meaning, of course, the Georetown map !

As to why it was / may be slow during the day, is that numerous members of the telephone families have been playing with it, and having great fun ! ... Now, if we could only get the java applet to run over our very dumb fire wall router (made in 1929), we'd really be getting somewhere !

Till next time, my vy 73 de John VE3NEC

Maybe this could be built into the MIC, or maybe this could
     be another PIC project?

     How about:
     1) Sense the distance traveled from the GPS string
     2) Define a *trigger* amount/distance larger than SA
     3) If the distance traveled is larger than *trigger*,
        Then post the data at rates according to amount of distance
        from last transmission point or velocity.
     4) Use the Ignition to run/halt the transmission by a
        sensing line or just killing power?

     Just some ideas.....
     73, Ted...

Dear Amsat-bb Members:

In responce to Miles Mann's notification of the freq. change. I would like to ask when effective will the .55 to .8 change occur or if it has already occurred already. I did hear John talking last Sunday to a few hams on my scanner radio in Elkhart, IN. The time was in the early afternoon.

Going back to the freq. change: I will inform the newspapers in my area as to the change whenever it is about to occur or has occurred.

Sincerely,
Keith Thews
kthews@oit1.iusb.edu

752. RE: Maps with county lines only

de jack cavanagh, kb4xf
In response to an overwhelming number of requests (3), here is the hack to makmap.bas to get only political boundaries

In line 29 of the source code change

```
        finx%=1
to
        finx%=4
```

When the program asks for the maximum number of features your answer will be 4

I have tested this one time for Wisconsin for a 64 mile map center on 44N 89W

```
This will work FB for land-locked states.  For coastal or Great Lake states
like WI the shore line is needed. In this case change line 29 to read
        finx%=2
You will then get rivers and small lakes too, but mapfix can take them out.

gotchas
 1-You need the complier BASIC QuikBasic 4.5 (qb45.exe) to run makmap
        becasue of the large arrays

 2- qb45.exe must be invoked with large memory option with the commnad
        line:  qb45 /ah

RE 2M Formats:
   I have just learned that USGS has a new 2M CD.  The limited description
that I found on the internet suggest that data is current as on Dec 1994.
However, the format (one of the three on the CD) used for makmap is not on new
CD.  I have sent for data sheet from USGS.  If change is needed and APRS users
want it, I could have a new program out by end of year.

Gee......Maybe this would be an OPPORTUNITY for a REAL Space Digipeater!
No, I'm SERIOUS!!!

If they're going to be on 145.80 why not try to get permission to use the
digipeater on a restricted basis.  Perhaps on only certain orbits (such as
late night hours outside of the normal voice/digital operating periods)?

Here's the best opportunity we've had since SPRE!  How do we get this done?

It works fine on the version I'm using, APRS77B. You just select
'dgps' under GPS modes. I'm using a laptop with a pcmcia second
comm port so I don't know if it works in the single port HSP
configuration. No reason to suspect it doesn't.

Unrelated but interesting: the two port APRS setup only seems
to work when I select the TNC to COMM2 (PCMCIA slot) and the
GPS in COMM1 (regular serial port). No idea why. Does anyone else
have this problem? Perhaps I made some goof in the initial setting
and it means nothing.

```

Yea, that depression era computer equipment is real hard to work with!

Now, for those of you that can run javAPRS directly on your computer, I
have an HTML file that will put the Atlanta APRS server, a couple of
Bob's semi-live data files, and John's live data all on the same applet.
Pretty neat! (It won't run under Netscape because of security issues, but
stand-alone applet viewers like the Java Development Kit have the option
of turning the security off.

Subject: Mir Frequency change

The Space Station Mir, may have a Frequency change soon.
The Radio Club IARU, decided to change the frequency for the space
Station Mir.
This IARU radio club does not have any equipment on Mir, yet they decided
to
change Mir's Frequency. The Mir Amateur Radio Experiment Working Group
North America (MAREX) is opposed to this frequency change because in
Region 2 (the USA), the QRM caused by adjacent channel interference
would make access to
Mir extremely difficult for expirenced stations with Oscar class
equipment.
And impossible for anyone with a lesser station.

FACT

1. Satellite FM requires a 30k Clear channel, on either side of the operating frequency!
2. 145.770 - 145.790 are packed with full time unattended uncorrdinated packet
repeaters and APRS beacons!
3. The ERP required to hit Mir will increase from 5 watts ERP to over 5000 kW
ERP
4. Ground Stations in the USA will not be able to hear Mir when there is any
local packet activity between 145.770 - 145.790

The MAREX Working Group of NA, recommend using the two Satellite subbands for
all future Manned space flight amateur Radio Activities.

Band 1, 144.300 - 144.500
Band 2, 145.800 - 146.000

In Band 1 we recommend for Mir and ISS, any frequency between
144.325-144.475
In Band 2 we recommend for Mir and ISS, any frequency between 145.820-145.830

An impact study was done to determine the impact on the SSB activity to Region
1 of having an
uplink only to Mir and ISS. It was determined the impact of having an FM
uplink to Mir and ISS on SSB activities in region 1 would be absolutely
Minimal and should not
be considered as a factor.

Sincerely

G. Miles Mann

MAREX Activities Coordinate North America

Hello MIR crew !
On behalf of Sergej Samburov (RV3DR) and the
SAFEX team, this needs to be done IMMEDIATELY:

1. Set up a message on 70 cm beacon (SAFEX QSO mode)
   saying

   To all hams around the world.
   SAFEX, SAREX, MAREX will be in a conference
   from 4th November through 5th November in
   Houston, Texas.
   This is an international conference for future
   space HAM goals.
   The participants wish ALL hams to work together.

2. IMMEDIATELY change the MIR's 2 mtr frequency for
   all modes (packet and voice) to 145.800 MHz

3. Send beacon on 2 mtr packet saying

   NEW MIR QRG 145.800 PACKET

Perhaps you didn't understand the original question or the concept. A variable rate beacon would be very advantageous in a mobile stand-alone tracker. Smart-aleck answers that aren't even funny do no good for a person asking a legitimate technical question.

The easiest solution would be a firmware upgrade from TNC makers, but my personal experience with most of them has been negative, when asking technical questions or trying to offer suggestions. I've found that calls to Kantronics result in finding out that I know more about their product than the people answering the phone. And they won't let me talk to any one in the design and engineering dept. AEA ditto. Varying beacons based on movement of the vehicle as parsed by GPS should account for SA. Often times my GPS will give ground speeds of 2 to 3 MPH when the car is sitting still.

So it's probably up to APRS users to find a solution. My first suggestion would be to tap power off a switched accessory terminal of a car's fusebox and connect it to a small relay to control the variable rate. I suppose this could be controlled in other various manners: A switch that is activated when the car is placed into gear, or even a seat-pressure switch.

This could be connected to a small timer circuit (555) that disables/enables either the PTT line to the TNC or in some other way inhibits the transmitter from TX'ing. Other design considerations should be proper isolation and some method of timer/tx feedback, so that the timer circuit doesn't shut off the the system when it is keyed up. I know this is a probably not a major concern, but with my luck my system would get into some kind of loop where it would time out and never send any packets.

Another consideration is how to get the timer to sync with the beacon. Say we set the normal beacon rate to every 5 minutes and want it to beacon every 20 minutes of so when the car is shut off. To make sure that the RX is enabled, we'd need the set the timer so that it allows packets to be transmitted for a period longer than the beacon rate. In the above example we'd need to have the timer disable TX for 15 minutes or so and then enable TX for 6 minutes or so (to make sure we cover a complete beacon cycle). Of course this may allow in rare cases for two packets to be sent in the low beacon rate. Perhaps some form of active feedback would be better, but probably a whole lot more complex. Of course, if one wanted to alter the beacon rate of the TNC it would be advantageous for the timer circuit to be programmable for "sleep time" and "enable time."

Perhaps someone has a design for just such a timer circuit.

73,

Mark KC7BXS

Hi All,

On Wed, 30 Oct 1996 Mark Humphrey wrote:

>What happens in the log if the number received from a partic-
>ular station exceeds 99?

This happened here in the Tri-state area not long ago when a station hastily started up APRS and left the office, inadvertently setting the beacon rate of his TNC (no computer) at 30 seconds using an effective path of RELAY,WIDE,WIDE (actually, I was the relay, WA2JNF-4 the first WIDE, then a generic WIDE.) Since I heard him directly as well as both of those WIDEs, my "H" list on him reached 99 within about three minutes!

Fortunately I knew which repeater this fellow hangs out on and told him about it. He hightailed it back to the office and changed it that evening. Nonetheless, his beacons were taking up better than 75% of the available bandwidth! Embarrasing! 73

Reference Ralph Fowler's suggestion about variable reporting rate and Bob's observation that he can control this, but obviously only if APRS is controlling the beacons. Bob (APR) has made this suggestion to us a number of times.

We have added Ralph's suggestion to our upgrade list. It will get added to the code, but I cannot promise any availability date yet. Will also look at a slow/fast rate toggle line which was suggested in another message.

APRSdos REPLY/COMMENT: APRS has always had this feature. If your GPS position does not change, then APRS decays the posit. But with the effects of selective availablility making even a fixed station appear to move, this doesnt help. ALso it means you have to leave the LAPTOP on in the carr all the time if you want APRS do do anything...

Rendered body type: text/plain

The old format USGS/2M data for a few Midwest states can be found at:
ftp.tbcnet.com/pub/jleonard/2M_Maps
See the README.txt file.

In this directory are the old format USGS 2M maps for:
1. State and County lines (mw_poli.gra)
2. Water bodies (mwh2o.gra)
3. Major Roads and Interstates - may be dated (mw_roads.gra)

4.   Streams (mw_strea.gra)
5.   The conversion program for those maps, USGS2MAP.BAS, included in
        the APRS program

To make a map with county/state lines, use mw_poli.gra and also mwh2o.gra
for Lake Michigan and the Mississippi River, for example.

Just follow the instructions in the USGS2MAP program.

These maps cover the following states:
IL
IA
IN
MO
KY

Those are the only states that I have info on.

Thanks, Gwyn. Always a joy when a manufacturer listens... and acts!

Not all manufacturers are that way. Call me sometime!

We are already researching methods to provide this feature in our GPS
support functions.

That is correct. It may be rather software intensive to filter out all
non-real motion, but probably some 90 or 95% could realistically be
detected.

What is the feasibility of handling this problem via the tnc?  Is it
possible to read the prom in the tnc and write a small routine that could
handle this and then burn a new prom?  This is provided there is a free
IO line that could be used for sensing the vehicle's status.

I too have the Garmin 55 AVD GPS. I use the DOS version for two reasons.
One it is from the original author and is regularly updated and Two it
works well with my Agrelp DFjr Doppler DF.

Don't get me wrong, the Sproul Bros are doing an excelent job porting
over APRS to Mac and Win. But they are yet to be proven as DOS APRS. I'm
just one of the original DOS men I guess. .... nuff sayd....

For you info my setup is a 486 laptop, KPC-3, Garmin 55 AVD, DFjr ADF,
MFJ DataRadio, two turtle doves and a antenna in a tree!!!!

Fairly straightforward.  0.1 minute of latitude is 185 meters.
Similarly
for longitude near the equator.  If lat or lon changes by 0.1 min.,
posit
rate is maintained.  Otherwise it is slowed.  This approach does not
allow
one to set a "trigger", but would handle the problem as originally
mentioned.

I can't speak for W7LUS, but he's probably using a Kenwood TS-50S, or
something as compact as the TS-50 HF rig.  I use the same rig in a
Cessna 337 Skymaster, with an AT-300 auto-antenna tuner.  The rig works
great, and  many lives have been saved using the TS-50 while flying SAR
over the Florida Straits.  The TS-50 is slightly larger in size than a 2
meter moble.  W7LUS's 18 wheeler... well I suppose you can use something
somewhat larger.
Take care Hal.

Please understand the following. WE ARE NOT AND HAVE NOT ported APRS to Mac
and Windows, we wrote our version ENTIRELY from scratch implementing the
APRS ideas and protocols.  The Windows version IS a port of our Mac version.

To the best of my knowledge, the only important feature that APRS has that
we do not yet have is alternate digi-paths.  HSP took much longer than I
planned but that is now fully working.

The DF device I mentioned is a Doppler Direction Finder sold by Agrelo
Engineering. Joe Agrelo is on this newgroup. Anyhoo, they also sell a
Multi Port Adapter. This little jewel combines all the components (TNC,
GPS, DFjr) into a single serial port. I too only have a single serial
port. I tell ya it works great! However, if you do not wish to purchase
the MPA or the DFjr, there is a switching adapter that you can build. It
is in the GPS.txt file in the Readme Directory (DOS version) I think.
There you will find the scematic for the device. I built one and it
worked right the first time. Your choice!

Have Fun!!!!

W4WWQ's reposting of Buck (K4ABT)'s message said "... APRS guys know that
if/when a 30 kHz >>WIDE<< (emphasis mine) goes on 145.800 ...".
It is not that the signal is 30 kHz WIDE! My understanding is that the

signal is "conventional FM practice" bandwidth. I'm sure that the original
posting included an allowance for Doppler shift + frequency errors + guard
bands.

Also note that the overall problem is an international one. Remember that in
MOST of the world, the 2M band is only 2 MHz wide (144-146); we in Region 2

have the "luxury" of a 4 MHz band and this "elbow room" has tended to make us less tolerant of frequency sharing.

I take some credit/blame for the choice/use of 145.79. When the 145.5 to 145.8 spectrum was "opened up" for digital use about 5 years ago, here in the MD/DC/VA area we chose to "allocate" 20 kHz spacing channels on the odd 10 kHz frequencies. I argued voiciferously that the "top" 145.79 channel would have future problems being immediately adjacent to the 145.8-146.0 international satellite allocation. In the local band-plan, I put 145.79 on the list as "experimental" "for the development of new techniques" "use it with caution" type of notes. The other 145.5 - 145.8 frequencies were gobbled up for PBBS, local chat, and DX Cluster applications. Bob (APR) was beginning the development of APRS as a "wouldn't this be really neat" experiment. I suggested that 145.79 would be a suitable "test bed" for him to use, while offering the comment that there may well be satellite QRM problems. In the subsequent years, 145.79/APRS lost their "experimental" virginity and spread like wildfire. So the "problem" is not a "new" one. Nobody should be surprised and nobody show do around decrying the fact that all of amateur radio relies on shared resources.

--------------

Another interesting solution would be for a standalone TNC to have the
smarts to reduce the beacon rate when the speed drops.  The TNC could have
two beacon rates and a speed threshold to dictate which rate to use.  For
instance BLT EVERY 1,60 could be used to set 1 minute and 60 minute rates
and SPDTHRSH 10 could set the TNC to use the second rate at speeds less
than 10 mph.

Hopefully the TNC manufacturers are still monitoring...;-)

Now that's the kind of manufacturer response I like to see!

Now if we can work on getting Kantronics to do the same. There are a lot
of KPC-3s being used as standalone trackers. I don't think Kantronics
monitors this SIG, but their email address is support@kantronics.com so
lets all let them know about this, okay!

FWIW Gwen, I have PacComms AND Kantronics and I like to see all
manufacturers remain competitive. ;-)

Rendered body type: text/plain

Hi All;

Just for the heck of it, I did some number crunching.

If, as recommended for my truck, I leave the GPS-20 running all the time
and just turn the radio and TNC on and off with the ignition switch...

The GPS-20 draws 180 ma. That's 4.32 A/hrs per day. I start the truck up
twice a week and drive into town. That results in a drain of 17.28 A/hrs
from the battery when the truck sets for four days. Automotive batteries
are no longer marked for A/hr rating, but that size used to be
considered about 50 A/hrs. That means I am discharging my battery by
about 35%. Automotive batteries are shallow cycle batteries and cycling
them lower than 20% will significantly shorten the life expectancy...

I don't think I'll try this.

The motorcycle has a 19 A/hr battery, but I am willing to leave it on a
trickle charger when it is parked at home. Otherwise, it will only be
parked about 10 hrs. That would be about 10% discharged. That's
acceptable, plus the motorcycle has a kickstarter.

That brings up a question. The most effective location for my GPS
antenna is on the motorcycle's headlight shroud. Has anyone tried to
build a patch antenna that conformed to a curved surface? If so, how
does that affect the efficiency? The idea would be to replace the
aluminum shroud with a fiberglass (or plastic) one, and mount the
antenna under it, so it is hidden.

regards,
Joe kf4dys

6. HELP! PEET BROS U-2000 AND WINAPRS?

From: BordingK@aol.com
Date: Fri, 1 Nov 1996 09:17:56 -0500
To: aprssig@tapr.org
Cc: ksproul@hardees.Rutgers.EDU, aa0mm@cjnetworks.com
Message-ID: <961101091755_134901774@emout15.mail.aol.com>
Rendered body type: text/plain

1. Sorry to ask this again, but I'm still baffled in my attempts to get a
Peet Bros U-2000 to display and send Weather data via WinAPRS. The few
responses I've gotten in this six month quest have not been the break thru I
need. Keith Sproul said wait for WinAPRS 1.16. I have, but still no data
out!

2 Set-up is as follows: WinAPRS 116, PK-12 on COM1, Peet U-2000 on COM 2
(2400 buad), Peet Bros connector. APRS works great, no weather displayed on
Weather, Automatic Weather is selected under Automatic Input, Com2 (Peet) is
2400,8,1,None. Wx Report is set at 15 minutes (as per note on WinAPRS page),
Weather/RDF Settings are Peet U-2000 and .01 in Rain Gauge.

3. U-2000 puts out the following as view thru both Windows Terminal and
WinAPRS Windows/Terminal/Port Selection. Data is as follows:

```
!!005300E202C7030D27BE032703E8----01140587030C0032
!!005100EC02C7030D27BE032703E8----01140587030C0032
!!005100EC02C7030D27BE032703E8----01140587030C0032
!!005100EC02C7030D27BE032703E8----01140587030C0032
!!004500E102C7030D27BE032703E8----01140587030C0032
```

4. Peet Bros Tesh Support says that if I'm seeing the above data from within WinAPRS and still not getting WX packets transmitted, then there's a problem with WinAPRS. Peet Bros also said they have WinAPRS in their shop and have been unsuccessful in getting it to work outputting weather to other stations via APRS.

5. Any suggestions will be greatly appreciated. I'm going back to DOS APRS in frustration!!!!!

On Thu, 31 Oct 1996, Bill Jones wrote about the potential APRS/MIR interference...

> Well just as I hit the key to send the above, I noticed that MIR was
> approaching, sure enough, the switch to 145.800 has in fact been made,
> and as it turns out, MIR IS transmitting, and although I missed the first
> half of the pass,....

APRSdos REPLY/COMMENT: OK, guys, I've been warning you that this was comming. We must share the band. There are only two things we can do:

1) Run minimum TRANSMIT power from digipeaters. 5 watts should do fine if it is in a residential area.. More if it is FAR away from satellite operators.

2) Remind all satellite operators that they can set their radios to 145.805 for *monitoring* purposes since MIR always approaches with +3KHz of doppler. If the pass is active, then they can manually tune down through the pass. But monitoring on 145.805 will allow their receiver to not open squelch on all the packet activity on 145.79 most of the time..

3) Taking a "Holyier than thou" attitude and saying we were here first is ABSOLUTELY not going to benefit anyone. Please be nice, and lets see how it goes...

Too bad they dont like us to digipeat our beacons through MIR! Then we would all be happy, and I would invite them to move the MIR radio to 79!!!! I believe their uplink is on 145.20 I think Ill listen on the next few passes and see if I hear any APRS packets...

>Gwyn Reedy <gwyn@paccomm.com> wrote:

>>We have added Ralph's suggestion to our upgrade list.

OK guys, I also have a suggestion that I would like the TNC mfgs to look at.

I have been running airmobile a lot the past few weeks, and plan to in the future. In my aircraft I use a Motorola Encore to feed my KPC-3 but also have a GPS in the aircraft that puts out ARNAV data stream rather than $GPXXX. The ARNAV format is over 400 bytes long. Even though APRS can parse the ARNAV string (with special registration) you guys would kill me if I started sending that long data string from between 16,000 and 25,000 feet. What would it take to add a ARNAV mode to the firmware that would parse out the data required to build a $GPRMC and a $GPGGA sentence. This woul save me having to carry an extra GPS into the aircraft to find a unobtrusive location to put my hockey puck antenna. It is also one less electrical connection I have to worry about.

The other thing to look at is that all the CAP aircraft will be GPS equiped over the next fews years with Northstar M-3 Lorans. National is buying them in 100 lots and issuing them to aircraft as they can. This would be a big help in putting APRS in CAP aircraft without needing a second GPS in the aircraft and all the cables associated with this kind of removable gear.

In my Mojave I had the radio shop drop a DB9 connector from my King KLN-90B and have recorded data from flights lasting from 30 minutes to 2 hours in case you want to look at the data stream. Oh yes, I also the the key to reading the data stream!

Thanks, Larry. Of course our objectives are not identical. We enjoy being supportive (It is more pleasant to receive thanks than irate messages). However I want to win customers by being supportive and it doesn't bother me when our competitors aren't responsive! Anyway, we'll try to get this done sooner rather than later.

11. Future releases of WinAPRS

From: Mark Sproul <sproul@ap.org>
Date: Fri, 1 Nov 1996 10:41:25 -0500
To: aprssig@tapr.org
Message-ID: <v03007803ae9fbea73395@[165.1.27.174]>
Rendered body type: text/plain

To all WinAPRS users both registered and un-registered

As many of you are aware, I have taken a little bit of a break from WinAPRS development over the summer and HSP took a bit longer than all of us had hoped to get finished. I had to back off a little or face total burn out. I had a good summer and am now ready to dive back into burning the midnight oil programming.

I am going to be doing lots more work enhancing WinAPRS and MacAPRS, we will also be working on X-APRS this winter.

Mac/WinAPRS has a great future, there are lots of major enhancments coming next year but many of the ideas are much to early to discuss. I am also working on my web server to serve you better with faster access to the files and documentation.

Some of the new features involve

Weather display, many new features and options
Civil Air Patrol - Search and Resque
More database integration
More display lists of data (can we say "Information Overload")

I have a couple of questions for all of you.

1) Do you like the current release rate, about one version a month, normally with several new features and bug fixes or would you like more releases. I prefer the former because it gives me more time to do testing but I want to hear what your preferences are.

2) What features do you want to see added. Please THINK about this one first realizing that I still have only managed to find 47 hours in a day and cannot do everything. Also, I do and have always kept ALL feature requests that anybody sends me, I keep them and go back over them fairly often. A feature that gets lots of requests gets done quicker than one that only gets one or two requests.

   Currently I am working on (not in any order)

   PRINTING
   FIND (data base search)
   ENHANCED WEATHER DISPLAY
   GRAPHS AND STATITICS, the graph windows that are in MacAPRS
   HSP DLL for Windows 3.1

Please give me your input on these and any other aspecsts of MacAPRS or WinAPRS

Mark Sproul

12. APRS *.hst contents and format

From: gbaumgartner@mail.cybg.com
Date: Fri, 1 Nov 1996 16:14:32 +0000 (GMT)
To: aprssig@tapr.org
Message-ID: <9611011614.AA06387@mail.cybg.com>
Rendered body type: text/plain

I've been looking for some information on the format of the APRS history files to aid me in some post-flight analysis. I'm a member of the Illinois Wing CivilAir Patrol where we are using APRS extensively to track our resources on training search missions.

I've seen some "discrepancies" in the history logs and am trying to figure out if they're a configuration problem with the GPS, TNC or APRS. We're currently using the DOS version (a 7.? version but I'm not sure which). The TNCs are KPC-3s and the GPSs are "black-box" Motorola units (don't have a model #).

For example, in on log we have:

```
IL0031    221537 @221537/4113.90N/08435.60W1000/000/A=3D000
```

and in another for the same resource (although on a different day):

```
IL0031    071419 @071918z4150.74N/08959.51W1GGA/NUL/raw*/good GGA FIX/A=005542
```

On one of our resources which is transmiting both GGA and RMC sentences

```
IL1130-7  071451 @071950z4127.15N/09030.12W'125/1.1/raw*/good RMC Fix/A=000764
```

and occasionally in the middle of the flight we'll see

```
IL1132    071048 @071557z4155.06N/08816.23W2GGA/NUL/raw*/Last gps fix/A=001187
```

and finally a real bizare looking sequence of reports from the middle of a flight:

```
IL0032    241356 @241356/4139.03N/08812.27W2000/000/A=3D000
IL0032    241357 @241357/4136.82N/08812.05W2000/000/A=3D000
IL0032    241359 @241359/4136.22N/08813.89W2000/000/A=3D000
IL0032    241400 @241400/4137.23N/08814.26W2000/000/A=3D000
IL0032    241401 @241401/4136.96N/08813.99W2000/000/A=3D000
IL0032    241919 @241919/4136.56N/08815.55W2000/000/A=3D000
```

here the time jumps five hours, then on the next report, it's back to normal but the day has changed...

```
IL0032    251404 @251404/4136.51N/08817.14W2000/000/A=3D000
IL0032    251405 @251405/4136.09N/08815.99W2000/000/A=3D000
IL0032    251406 @251406/4135.28N/08814.27W2000/000/A=3D000
IL0032    251408 @251408/4137.01N/08815.26W2000/000/A=3D000
```

We're going to try to correlate raw data from the TNC to these reports in future missions but for the time being, can any one point a place I can look for explanations of the different fields and the values they might contain.
Some specific questions based on the above data:

why in some cases we see 000/000 for course and speed an in others GGA/NUL or NUL/NUL.

why we see floating point values in course and speed. (I'm guessing the NMEA sentence being parsed might not be what APRS is expecting). Yet "good RMC Fix" is reported.

why do we see "last gps fix" in the middle of a flight.

the altitude of 3D000 is interesting. :-)

what is /raw*/ supposed to indicate.

and any ideas about the time warp :-) would be appreciated.

Any help would be appreciated.

Message-ID: <9610018468.AA846866018@ccintnet.wrq.com>
Rendered body type: text/plain

The GPS-20 draws 180 ma. That's 4.32 A/hrs per day. I start the truck up twice a week and drive into town. That results in a drain of 17.28 A/hrs from the battery when the truck sets for four days. Automotive batteries are no longer marked for A/hr rating, but that size used to be considered about 50 A/hrs. That means I am discharging my battery by about 35%. Automotive batteries are shallow cycle batteries and cycling them lower than 20% will significantly shorten the life expectancy...

I don't think I'll try this.

You could buy a small solar trickle charger and plug it into your cigarette lighter when the truck isn't used...of course, if you park your truck in a garage, there are some issues to this ;-)

Mark,

I am going to propose to you something -- and maybe we can get some support for it.

I run TNOS PBBS. In the near future, this system will have an Internet gateway to other HAM systems. I personally would like to see APRS support in such bbs systems as they have a good backbone for forwarding info.

For example, I can netrom connect to system over 300 miles away. While that does not always work well, my idea is to join the two technologies for better APRS connectivity. (god I hope this has not been done already).

I believe for the most part APRS uses HF gateways to get the "big picture". Would it not be nice if all the BBS's out there recognize the aprs broadcast packet from fixed and mobile stations and forward it on to a gateway??

My idea would include batching compressed aprs broadcast headers every minutes and forward this "packet" to a gateway and let that gateway infuse that into the rest of the aprs network.

Does this sound like something that is of interest??

I just was doing a little day dreaming today and stumbled on this.

Also, do you know of any aprs software for Line(UNIX??).

15. APRS..What am I?

From: agibbons@gatepoly.co.ck (Arnold Gibbons)
Date: Fri, 01 Nov 1996 01:09:56 -1000
To: aprssig@tapr.org
Message-ID: <199611011107.BAA10741@gatepoly.co.ck>
Rendered body type: text/plain

```
Bob...I have just been introduced to APRS by KE4SVH Joe McCarthy from the
S/v Navi-Gator presently visiting Rarotonga on a Pacific Cruise. Since 1988
I have been involved with the MM fraternity in their radio nets and for the
last 6 years have been providing daily weather bulletins on 14318.2 KHz at
0400 UTC.
Utilising donations from the visiting cruisers I have also established over
last 2 years a HF AMTOR MBO which I have just upgraded to PACTOR using Winlink.
I am amazed that APRS has not been promulgated to the Pacific cruising
fraternity. I have been looking for something like this to take the drudgery
of daily manual reporting and recording of vessel positions. This concept
provides a very simple mobile operation which doesn't tie crews to specific
times of the day to stand in line of 20 vessel roll call system. The
pictorial weather information I can get from the APRS would be of great
value to myself and the local weather forecasting service. I also act as an
weather data gathering station with the data being provided by the cruising
yachts. My activities are wholly voluntary and the only income come by way
of donations from grateful yachties.
My question is..What class of station am I in the APRS framework? The text
information doesn't seem to cater for a remote HF station receiving and
'Digipeating' vessel position and report packets covering about 2000 miles
radius of the South Pacific region. I have no access to a VHF system except
possibly via satellite relay to USA home BBS's at some later date. Would you
please give me a typical Unproto and Myalias setting to get things started.
I have posted my registration ($US40) but as Joe and I are trying to get
familiarised, I wanted to set my station on 10150 in the manner in which it
will be used and which Joe will access for trials on his journey to NZ in
about 2 weeks time. I am alone here in the use of packet communications and
for your information, it is my intention to close the MBO and operate APRS
on 10150 KHz from 1000 to 1700 hrs UTC.

Any suggetions or advice would be greatly appreciated.

Best regards and thanks for a very useful piece of Amateur software.

de Arnold ZK1DB.

A couple of suggestions:

1. The commercial version of APRS (and maybe APRS too - ask APR) can take in an ARNAV string and output the NMEA strings. If you have APRS running in your aircraft, that can handle the translation for you. This was developed for use in aeromedical helicopters at St. Joseph's Hospital in Tampa.

2. PacComm commercial TNC code has supported ARNAV format for 3-4 years now. Not a well publicized feature, but available. We had some good talks with CAP folk some time back on this matter but not recently. Our TNC code does not support the format translation you need however. I'd consider adding that if 100 people could make use of it, but since it would be a lot of work it is hard to justify for limited use.

KF4DYS said (in part) concerning power consumption:

> The GPS-20 draws 180 ma. That's 4.32 A/hrs per day. I start the truck up
> twice a week and drive into town. That results in a drain of 17.28 A/hrs
> from the battery when the truck sets for four days. Automotive batteries

Here is a way to cut the number in half, doubling the battery lifetime.
A firm called Power Trends offers a small switching power regulator that
replaces a 7805 and provides ~85% power conversion efficiency. If you have
a DigiKey catalog handy, or check http://www.digikey.com or call them at
1-800-DIGIKEY you will find that the PT5101 or 78SR series regulators
will cost you in the $10-$15 range and require only the regulator plus
an external 100uf cap, plus an optional zener diode. From a 12v input,
counting the converter's efficiency, the power drain will be in the 90-100
ma range.

You can also see the info on the PT5101 at http://www.powertrends.com
FYI -- the Real! Soon! Now! TAPRized version of my "Totally Accurate Clock"
includes the PT5101 or 78SR series regulator as a power/heat saving option.
More on that soon.

73, Tom

Well, since I'm at work, I cannot think of all the things that are not
implemented..

- SAVE

- When you do the settings block, in one of the default text strings that
is sent, it says MACAPRS in the WINDOWS version.

- How about the program remembering which map it was using and its
location? Like the dumb dos version does?

GM all,
I'm having trouble updating my WinAPRS 114 using the downloaded W116updt.zip
I' tried using pkunzip ver 2.04. The program unpacks all the files OK until
WINAPRS.Exe. It gives me the error message that WINAPRS.EXE contains a CRC
sum error and that it can't unzip it. I tried downloading again and go the
same error message. What's happening here?? Thanks for any help.

Subject: RE: [APRSSIG:6068] Future releases of WinAPRS

Mark,

I am going to propose to you something -- and maybe we can get some support for it.

I run TNOS PBBS. In the near future, this system will have an Internet gateway to other HAM systems. I personally would like to see APRS support in such bbs systems as they have a good backbone for forwarding info.

For example, I can netrom connect to system over 300 miles away. While that does not always work well, my idea is to join the two technologies for better APRS connectivity. (god I hope this has not been done already).

I believe for the most part APRS uses HF gateways to get the "big picture". Would it not be nice if all the BBS's out there recognize the aprs broadcast packet from fixed and mobile stations and forward it on to a gateway??

My idea would include batching compressed aprs broadcast headers every minutes and forward this "packet" to a gateway and let that gateway infuse that into the rest of the aprs network.

Does this sound like something that is of interest??

I just was doing a little day dreaming today and stumbled on this.

Also, do you know of any aprs software for Line(UNIX??).

From: Mark Sproul
Sent: Friday, November 1, 1996 11:01 AM
To: aprssig@tapr.org
Subject: [APRSSIG:6068] Future releases of WinAPRS

To all WinAPRS users both registered and un-registered

As many of you are aware, I have taken a little bit of a break from WinAPRS development over the summer and HSP took a bit longer than all of us had hoped to get finished. I had to back off a little or face total burn out. I had a good summer and am now ready to dive back into burning the midnight oil programming.

I am going to be doing lots more work enhancing WinAPRS and MacAPRS, we will also be working on X-APRS this winter.

Mac/WinAPRS has a great future, there are lots of major enhancments coming next year but many of the ideas are much to early to discuss. I am also working on my web server to serve you better with faster access to the files and documentation.

```
Some of the new features involve

        Weather display, many new features and options
        Civil Air Patrol - Search and Resque
        More database integration
        More display lists of data (can we say "Information Overload")

I have a couple of questions for all of you.

1)      Do you like the current release rate, about one version a month,
        normally with several new features and bug fixes or would you like
        more releases. I prefer the former because it gives me more time to
        do testing but I want to hear what your preferences are.

2)      What features do you want to see added.  Please THINK about this one
        first realizing that I still have only managed to find 47 hours in a
        day and cannot do everything. Also, I do and have always kept ALL
        feature requests that anybody sends me,  I keep them and go back over
        them fairly often.  A feature that gets lots of requests gets done
        quicker than one that only gets one or two requests.

        Currently I am working on (not in any order)

                PRINTING
                FIND (data base search)
                ENHANCED WEATHER DISPLAY
                GRAPHS AND STATITICS, the graph windows that are in MacAPRS
                HSP DLL for Windows 3.1

Please give me your input on these and any other aspecsts of MacAPRS or WinAPRS

Mark Sproul

Gwyn, It is true that APRS can output the NEMA string, but, we are trying to
build a stand alone tracker so there will be no computer involved.

>2. PacComm commercial TNC code has supported ARNAV format for 3-4 years

I could use the ARNAV format now but, as I pointed out, the ARNAV data
string is over 400 bytes long.  With a high antenna this would add
significant QRM that I don't want to.

As far 100 people involved, anyone else on the SIG have any interest?

Reemeber that this is an INTERNATIONAL problem. The band plan in Europe is
VERY different from the US and there are not repeater inputs on 145.200.
And Japan has NO repeaters on 2M.

I am certain that if some wise sage can find a "universal" "perfect" frequency
that will solve the world-wide problem, they would be welcomed with open
arms!

APRSdos REPLY/COMMENT:  The simpler way is for PacComm to have an ARNAV
mode that only sends the first N bytes and then ignores the rest of the
400 bytes.  LAT,LONG,CSE and SPD are all in the first 20 bytes or so...

Welocme!!  Glad to hear from you.  Yes, PARS is perfect for you, but it
has been slow to catch on... I guess the cruisers are in their own world,
hi hi.  You never said where you ARE, except for a name starting with R
which I have never heard of, hi hi...

Your V# is 02547 and your GPS number is 857 and WX number is 650 if you
have a PEET or Davis WWX station.

Set your unproto to GATE,WIDE
and set your MYGATE call to GATE (but I think you said you have no VHF
APRS network, so it really doesnt matter....

Ive gotta run right now, but would be happy to chat more.  What is your
LAT/LONG, then I can plot you on my APRS map!  and in fact, I can let
everyone else see whre you are too!

 Reply mail addr:  wb4apr@amsat.org
See  APRS  LIVE:  http://web.usna.navy.mil/~bruninga/aprs.html

Mark,
        Do you think that you could add auto HTML page generation of the display(specifically the
weather stuff) so that we could post it directly on a web site?

Subject:	[APRSSIG:6068] Future releases of WinAPRS

To all WinAPRS users both registered and un-registered

As many of you are aware, I have taken a little bit of a break from WinAPRS development over the summer and HSP took a bit longer than all of us had hoped to get finished. I had to back off a little or face total burn out. I had a good summer and am now ready to dive back into burning the midnight oil programming.

I am going to be doing lots more work enhancing WinAPRS and MacAPRS, we will also be working on X-APRS this winter.

Mac/WinAPRS has a great future, there are lots of major enhancments coming next year but many of the ideas are much to early to discuss. I am also working on my web server to serve you better with faster access to the files and documentation.

Some of the new features involve

Weather display, many new features and options
Civil Air Patrol - Search and Resque
More database integration
More display lists of data (can we say "Information Overload")

I have a couple of questions for all of you.

1) Do you like the current release rate, about one version a month, normally with several new features and bug fixes or would you like more releases. I prefer the former because it gives me more time to do testing but I want to hear what your preferences are.

2) What features do you want to see added. Please THINK about this one first realizing that I still have only managed to find 47 hours in a day and cannot do everything. Also, I do and have always kept ALL feature requests that anybody sends me, I keep them and go back over them fairly often. A feature that gets lots of requests gets done quicker than one that only gets one or two requests.

Currently I am working on (not in any order)

PRINTING
FIND (data base search)
ENHANCED WEATHER DISPLAY
GRAPHS AND STATITICS, the graph windows that are in MacAPRS
HSP DLL for Windows 3.1

Please give me your input on these and any other aspecsts of MacAPRS or WinAPRS

That sounds rather easy to do. Will check it out.

I know the darned MS WINMAIL.DAT is getting sent out with these messages.
I've never found a way to stop it, but will be changing mailers soon. I
know the work around for MS Exchange, but it takes time and I'm 418
messages behind (not junk mail - messages requiring answers) so I'm saving
time on this one.

Arnold,

Here is some information which may be of interest to you.

PacComm has put together a low cost tracker for maritime use. It consists
of a GPS receiver integrated into a pactor modem. It will transmit the
vessel's location via FEC on a periodic basis over HF, thus greatly
extending the range of tracking possible.

If you wish more information, please let me know.

>
>As far 100 people involved, anyone else on the SIG have any interest?
>

I have a source of >>cheap<<<aircraft gps units which are great except the
strong is ARNAV.. If you look at the strig with a normal term program, you
will see all the needed info is in 4 strings marked A,B,C,D...the problem
seems to be there is no CR/LF to delineate the line...

If this problem could be solved, we can use all these cheapee Magellen Gps
units..

add me to the list of 100... 1 for the car and 1 for the plane..

```
Hi,

Can anyone give me an update on progress of the TAC kit that TAPR is
producing for interfacing with the Motorola Oncore and Garmin GPS-20
OEM GPS receivers? Any timeframe as to when it will be released and
approximate cost would be appreciated.

Regards,
Jeremy

Hey Dave, what GPS do you have in your Mojave.  I use Garmin-100's to
feed data into a PicoPacket, a KCP-3 and a HandyPacket.  The GPS comes
set to send ARNAV data, but it could be changed in the configuration.

Let me know if I can help out.  I have three Cessna 337 Skymasters setup
with APRS, and a 320.

If you set a station to be TRACKED, it does not save data UNLESS the object
moves N seconds. This is to make it so that a car with a GPS setting in a
parking lot 'stationary' does not continously chew up memory since the GPS
error will have it wonder a few hundred feet..

The ALARM delta is a similar deal, that if the station moves MORE than N
seconds, it will alarm. (Alarm not activated in the Windows version quite
yet)

 Subject: [APRSSIG:4707] Solution to Intermod Problem
    Date: Fri, 13 Sep 1996 18:29:23 -0500 (CDT)
    From: Mark Humphrey <mark@y100.com>
Reply-To: aprssig@tapr.org
      To: aprssig@tapr.org
```

I recall there was a thread going a few months ago about intermod problems, but haven't
heard much about this lately. I picked up a PAR Electronics model VHFDN152 2 meter
"Intermod Filter" last weekend at the FARfest in Gaithersburg, and want to report it
fixed my intermod problem, especially on the 145.79 APRS frequency.

My mobile rig is a Kenwood TM-733, which I chose due to dashboard space constraints.
Although I'm generally happy with its features, the intermod rejection on 2 meters is
poor. The "AIP" feature (which reduces the gain of the first RF stage) doesn't make
much improvement.

I use this rig frequently for mobile APRS, however I've had severe paging interference
on 145.79 (although many other amateur 2m frequencies were clean). Within a couple
miles of most of the local commercial tower sites, the interference was so bad it would
hold the DCD for several minutes and prevent my position packets from being sent.
Further investigation explained why 145.79 was being hit so hard...

Two of the "RC Paging" frequencies assigned to Radio Common Carriers in the Philadelphia
metro (and most other cities) are 152.24 and 158.70. When these frequencies mix in a
receiver's front end, one of the third order intermod products is 145.78, just 10 kHz
down from the APRS channel.

(2 X 152.24) - 158.7 = 145.78

Note that the deviation on the lower frequency is doubled, since its second harmonic is
what actually mixes with the higher frequency to generate the product. Assuming 5 kHz
peak deviation from each paging transmitter, the effective deviation of the product is
15 kHz, which easily spills over to 145.79. The "overdeviation" causes the modulation
of the product to sound distorted and obnoxious, not to mention that paging signals are
square waves to begin with.

According to the curves, the PAR filter provides a deep notch (nearly -55 dB) at 152.4
and appears to exceed 35 dB attenuation from 152.0 to 153.0 MHz.   That easily takes out
the lower paging frequency and eliminates the intermod. Below the notch at 145.79, the
insertion loss is less than 0.3 dB, and even at the "worst-case" amateur frequency,
148.0, a loss of only 0.6 dB is claimed, which is comparable to most bandpass filters.
The loss above the notch frequency is greater, about 4 dB at 160 MHz, but that still
lets me listen to NOAA WX, the Broadcast RPU channels, etc. Loss across the 440-450
band is about 0.2 dB, and it will handle 50 watts without melting down.

So if you're having paging intermod problems on 145.79, you might want to consider one
of these. I was skeptical until I tried it. The manufacturer is PAR

52. KPC-3 Help

From: huey@juno.com (Huey M Fourquet)
Date: Sat, 2 Nov 1996 14:55:00 PST
To: aprssig@tapr.org
Message-ID: <19961102.145502.3494.0.huey@juno.com>
Rendered body type: text/plain

I have a KPC-3 with Ver 6 firmware. It intermittently locks up in the transmit mode. I'm using it with a Yaesu FT209 2M HT (5 Watts) and a mobile antenna. The cable connecting the TNC to the HT has worked well with a KAM and the HT for many years. I've also used the same cable with a KPC-4 with no problems. The KPC-3 locks up in transmit and will not go back to receive mode until after power is cycled off and back on. The position of the "ht" jupper in the KPC3 has no effect on the problem.

What do ya think?

Rendered body type: text/plain

Greetings, all! As many of you know I support all of this APRS and Ham Radio hobby by playing (it's not really work!) high school band director in Burlington Junction, Mo. (West Nodaway R-I).

The Rocket Pride Band will be traveling to Indianapolis, Indiana, next Saturday and Sunday (11/9 & 10) to attend Bands of America's Grand National Championship Finals (we're just audience members for now...).

The kids have all seen the radio/GPS/Computer/APRS setup in what has been nicknamed, affectionately, "The Batmobile" and asked if I was going to set up the computer on the bus. "Of course!", I replied, "you didn't think I could go anywhere without my laptop, did ya?"

To that end, watch for "WNHS_Band" on your screens starting 0600 CST, 11/9! Our route is, as follows:

```
        US 71 to St. Joseph, MO
        US 36/I-72 to Springfield, IL
        I-72 (I think!) to Indianapolis, IN (arriving +/- 1800 CST, depart
midnight)
        I-70 to St. Louis, MO (stopping at Gateway Arch and Union Station)
        I-70 to Kansas City, MO
        I-29 to St. Joseph, MO
        US 71 to Burlington Jct., MO (arriving +/- 1700 Sunday)
```

Karla is staying home (can't imagine why she wouldn't want to spend 36 fun-filled hours with 40 teenagers and their parents!) so we'd like her to be able to track us as much as possible! If you have HF gateway capability, please activate your GATE along our route for the weekend...(for which we thank you, in advance!)

We're looking forward to meeting any of the APRS people in Indianapolis and to any others out there who may be band parents, etc. traveling to this event! I know of at LEAST one on the SIG already (Marion Catholic HS out of Chicago, talk to me!!!)...

Just 40 band members?  That's not too many to handle.  When I was in High
School I had to wrangle 24 squads of istrumentalists (96 students), plus
flag corps, and majorettes.  Now that was a challenge.  Of course, band
parents are a bigger pain than the students.  But it was fun.  I really
enjoyed it.  I recommend any parents out there with young children to get
them into a school music program.  It really is a pleasant diversion and a

lot of fun for the kids.  Students in my marching band introduced me to ham
radio.  :)

73, and have fun at the Nationals.

Wish I could attend.

I need clarification on the correct format for a BEACON string.  In
looking at on the air APRS BEACONS I found the following 4 categories ...

           #PHG
           yPHG
           HPHG
           -PHG

   I have studied the documentation for the APRS protocol which is very
good, but could not find the differences in the above, although I did find
the first one which is a # that indicates a DIGIPEATER, I could not find
the significance of the other three ( y  H  -).  BTW, I know what PHG is.

   I am not saying it is not there somewhere in the documentaion, merely
that I could not find it.

   Bottom line, what is prefix before the PHG mean?  Are there more than 4?
     1)    y
     2)    H
     3)    -

Hi Lef,

On Fri, 1 Nov 1996 you asked about:

>Band Pass filters????
>
>What are you folks using to reduce out of band interference on
>two meters?

     Although they aren't the products discussed on the SIG a
few weeks ago, I've been EXTREMELY pleased with the filters by
Digital Communications, Inc.  They make relatively small multi-
bay cavity filters for two meters, one and a quarter meters and
seventy centimeters (either 430-440 or 440-450) and they work
GREAT!  They will also custom-tune a set for any band you want
by special order.  The seventy centimeter unit has N connectors
and the other two use SO-239's.

     How do I know how well they work?  Half a mile (as a crow
flies) stand the two tallest (and ugliest!) buildings in The
Bronx.  There are about forty-seven grillion high-power pager
repeaters on the thing and from my antennas I can see them vis-
ually.  No intervening foliage, buildings, anything.  Without
the filters listening becomes annoying, disappointing, madden-
ing, distracting, impossible, headache-producing (take your
choice of adjectives or select your own!)  Plug one of these
babies inline and ... silence.  No beeps.  No screeches. Just
everything that's supposed to be there and nothing more!

     As I have dual-band antennas and internal duplexers on my
rigs, I bought two 2M/70CM external duplexers to split and re-
combine the signals on either side of the filters.
```

```
     These suckers aren't particularly cheap.  The 144 and 220
versions are about $90 each, the 440 one is $110.  But they've
got less than .5 db insertion loss, do well what they were de-
signed to do and have very pretty polished brass faceplates to
boot.

     Their address is:

          Digital Communications, Inc.
          Post Office Box 293
          29 Hummingbird Bay
          White City, Saskatchewan
          S0G 5B0 Canada

(to our friends in the north, forgive me if I misspelled the
name of your lovely province, but have you tried to spell the
name of the state we abbreviate as CT lately?!)

     They used to advertize in QST, but I don't remember seeing
them lately.  There's also available (on order) from your local
Ham Radio dealer.  After having dealt with numerous VHF QSO
Contests without these jewels and getting splitting headaches
from the garbage from paging services, I can tell you these are
a g-dsend!  I recommend them without hesitation.  73

Huey-  Here are 2 things:

Were you in stand alone tracker mode by chance?  If so, we found out that
you need to set CMSG to disconnect so that your TNC will not start
streaming GPS data if someone connects to its call sign. This has happened
during several events, trashing the frequency for several minutes

Several KPC-3's I used this summer as trackers locked into transmit for no
reason I could see.  They started sending data of some sort, but it was not
copyable.  I had to recycle power to get them to stop!

Some folks think it is when the internal battery gets low, but on the ones
I used during the Summer I changed the battery every day

On a tracker I made using an Icom 02AT, the radio would go into transmit
mode if the TNC was turned off while the radio was still left on.

As explained in the README files of Dos APRS.  The file called symbols.txt
shows H to be a lettered circle (if it were h, it would be a Hospital) , y
to be a Yagi QTH   and  -  to be a QTH.

65. RICK/KN6KB-5 S/V SECOND WIND

From: "William B. Bliss/WB6LPG" <wbliss@coastside.net>
Date: Sat, 2 Nov 1996 19:43:13 -0800
To: aprssig@tapr.org
Cc: wb4gqk@amsat.org
Message-ID: <199611030343.TAA18605@poseidon.coastside.net>
Rendered body type: text/plain

Attn APRS HF users, & Florida APRS'ers...

Rick/KN6KB-5 on S/V Second Wind, departed San Diago Oct. 28th
participating in the Baja Ha Ha race to Cabo San Lucas, Baja, Ca.
Sat. 11/2 departed Turtle Bay Baja, 2714.95N/11442.79W Crs 159/Spd
006 bound Magdalena Bay. Had QSO on HF 10151.03/LSB APRS @022130GMT
and skeds daily at that time. Cannot run GPS tracks continuously, HF
gets into autopilot, so 30M beacon position transmission couple times
a day.. Then would like Pactor QSO on 20M.
Any APRS HF station hearing him please uplink position on APRS maps
and QSO by APRS one liner messages if possible. Also uplink his positions
for HST tracking files.
He will continue down coast of Central America to Zihuatanejo, fly
home for Xmas in Melbourne, FL. Then resume trip through P-Canal and home
to Melbourne.
Would like to do Pactor to send traffic to his wife Marcia
(mmuething@juno.com). Any Florida station who runs Pactor BBS please
advise call and frequencies for PACTOR QSO's.. Anyone who can advise
frequencies used by W4DPH in Tampa area, please advise any info. Have
sent packet landline messages, but receive no replies or answers, from
W4DPH. Rick is aware of 40M MM voice nets and times by Jim/WB4GQK but
needs a PACTOR BBS station in Florida or South East US.
Again anyone copying KN6KB-5 or can help with communications or
Pactor QSO's, would be greatly appreciated. We are also trying to get
a complete APRS HST file of his voyage, would make a good Demo for
APRS demonstrations.
73's & Enjoy, Bill/WB6LPG@KE6WVQ.#NOCAL.CA.USA. and bbliss@juno.com

The easiest/fastest source for MCX xconnectors is DigiKey. You can contact them at 1-800-DIGIKEY or at http://www.digikey.com

I recommend the J-536 connector listed for RG316. It fits RG174 fine. The right-angle connectors are much easier to install and there is no need to pay for the gold finish. Digikey's 1-9 price is $5.23, dropping to $4.59 at qyty=10. If you have therir July/August 96 catalog # 964, they are shown on page 73.

Rendered body type: text/plain

Jeremy asked about the TAC project. It is getting close to an announcement. We do plan to say something next weekend at the AMSAT meeting in Tucson. We did an "alpha" run of my TAC-2 PCB which sorted out some minor problems but which was 99% success. I have one running here right now with my SHOWTIME software on the same computer as I'm using to type this reply. In that "test" we decided to change the mechanical mounting for the GPS rcvrs and to incorporate support for the Trimble SK-8 also. We also made some minor layout changes to accommodate an alternate switching power supply. Within the last hour I shipped off copies of the drawings to the small TAC design team for their review of the latest design changes.

We plan that some of the TAPR TAC team will meet in Tucson as a "splinter" meeting during the AMSAT meeting to plot the next steps. Given that we are all volunteers, it is unlikely that the kit will be announced in 1996, but I hope for an early 1997 date.

We have also begun discussion on the next step in the project, adding another PCB that will stabilize a low-cost xtal oscillator to be a ~1:10e9 to 1:10e10 frequency standard, but work on that won't begin until we get the basic TAC-2 "on the road".

These comments are purely my own, and do not reflect an official TAPR position! I am not in a position to commit TAPR to a particular schedule. I'm just doing the design.

For those of you who don't know about the TAC project -- we have demonstrated that several off-the-shelf OEM GPS rcvrs can produce sub-microsecond timing -- including the Garmin GPS-20 TAPR has made available to the amateur community. One brand of receiver (the Motorola ONCORE) produces timing at the ~30 nsec level! This development has been of a lot of interest to several professional communities and I've produced about 50 of my original "Totally Accurate Clocks" for them already. A number of amateurs are also interested in having such quality available in the shack for a number of new things. KA9Q & I presented a paper last summer that proposed an innovative signal processing scheme that can "buy" ~20 dB in weak signal work, bringing EME capability to Oscar-class stations. We see several interesting spread-spectrum applications on the horizon, including a new scheme for spacecraft ranging.

In addition to the "clock" function, the TAC circuit board will be a universal and very flexible way of mounting your GPS receiver and interfacing it to your computer. The TAC-2 has one mounting option that makes it mount in a disk drive bay in your PC.

For those of you interested in learning more about the TAC project, take a look at the material posted on my ftp server at:

ftp://aleph.gsfc.nasa.gov/GPS/totally.accurate.clock/

So, Jeremy -- be patient. We are working on it actively, and we will make a big "splash" when it is ready Real! Soon! Now!

Your right Bob,
```

I should not have said deviation (may just a deviat mind ha ha) or
feeble That is the way I have been setting it up. I turn down the power
crank up the mike gain until I get no more increase in power and then
set it back a bit and then set my power.

I run a weather station out of Mi. and when it is on hf I set my unproto
to gate wide. Is that OK?

No. We are speaking of the symbol that is one character before the PHG
begins. This is the symbol that determines which icon is displayed on APRS
(all variants) screens. It is asked for in setup, but not in relation to
the PHG. It has nothing to do with PHG.

72. AEA PK-12 powerup problems

From: fhickey@neosoft.com (Anthony Hickey)
Date: Sun, 3 Nov 1996 12:56:24 -0600 (CST)
To: aprssig@tapr.org
Message-ID: <199611031856.MAA09692@mailbox.neosoft.com>
Rendered body type: text/plain

I reset my AEA PK-12 with the reset command inside the aprs terminal window.
something went wrong and I can't figure out what. When I turn it on 4 of
the LEDs light up and and I get garbage on the terminal in all the baud
rates that I tried. The problem is that this does not looks like the
autobaud routine. There is one string of garbage sent out and nothing else.
If this is the signon with different comm settings then the the 4 LEDs
should go off. If it is the autobaud routine then the TNC would be cycling
through the different baud rates. So can someone please tell me what's
going on or if there is a way to do a hard reset with jumpers or something
like in the KPC-3 ??

Thanks, Anthony AB5QR

Anthony Hickey wrote:
>
> I reset my AEA PK-12 with the reset command inside the aprs terminal window.
> something went wrong and I can't figure out what.

Anthony:
Here's the proceedure that works for me.
1. Disconnect power and cables from the tnc.
2. Momentarily short across the backup battery.-Approx. 1-2 secs.
(small needle-nosed pliers or tweezers will work fine.)
3.Reconnect the power and serial cables.
4.Turn Power back on.
Now to your computer:
1. Change to your pplite directory.(Program that came with PK-12)
2. Delete the PPLTDEF_.CFG file.
3. Delete the PPLTDEF_.DEF file.
4. Start PPLITE.EXE and let the program initialze the tnc.
5. When program comes up, change to the dumb terminal screen.
6. Set up the GPS operation commands as per page 85 of the PK-12 manual.

```
    ie:
        type MY <your call sign>-9  enter.
        type UN APRS via RELAY      enter.
        type GLOC 6 (or a number from 0(disabled) to 255 (10 second
increments)  enter.
        type GNMEA1 $GPRMC (or whatever NMEA sentence you use.) enter.
        type GPSA ON  enter.
        type TBAUD 4800 (to match PK-12 terminal baud rate to GPS
reciever.)    enter.
        NOW TURN THE TNC POWER SWITCH OFF.
```

6. Exit the pplite program. (it will show an error because the tnc
has   been turned off.)

Now turn the tnc back on and start APRS you should be back on line.

Kantronics has had a history of their TNCs locking up in transmit mode.
The reason for this is to save a few cents for the onboard watchdog timer
that most (if not all) of the other TNCs use. With a watchdog timer, not
even a CPU failure would cause the TNC to lock in transmit, much less a
firmware crash.

I thought they learned their lesson the first time. I guess not.

Bob (WB4APR)

```
          I have been playing with the GPS Plots screen and think
     that it a really "neat" feature.  Now for the, "wouldn't it
     be nice if".

          Since I am running a GPS-31 I have no display to look
     at. How about parsing the $GPGSV of a PREVIOUSLY DEFINED
     MOBILE CALL SIGN and routing the data to the Plots Screen?
     Maybe, it could be one of the options when stations are
     hooked.  I could then send both the RMC and GSV strings and
     check status of the birds at a remote location.

                                   Thanks...Mark WB0NOO

To all I just got off from my contact With John (KC5TZQ) on Mir and his
comment to me was that I was on the wrong TX freq to him, he said that MIR
was Transmitting on 145.200 and Receiving on 145.800, so Earth Stations must
Receive on 145.200 and transmit on 145.800. There was some confusion in
earlier posting but this was from the John Himself.

There is an excellent FAQ and General document collection by the Kansas
City APRS Working Group at:

 http://home.sprynet.com/sprynet/ku0g/homepage.htm

This should get you started.

Hmmm...  All Kantronics TNC's have a watchdog timer, including the KPC-3.

I suspect that the problem with the KPC-3 locking up is an improper cable
set-up.  I had this problem with my HT and the instructions included with
the KPC-3.  It would work fine for a while, but then lock in TX.  Wiring it
as per Yaesu cleared up the problem.  I've also noted that voltage
transients can lock many TNC's in transmit as when you wire the TNC onto the
same power cable/supply as the transmitter.

Kantronics does not have a corner on this problem.  I've seen it in many
PK-80's and 88's.

Stray RF can also cause problems.  Use shielded cables and connectors.

And finally static electricity can play havoc on your electronics.
Something we're all to accustomed to here in the desert southwest.  Low
moisture content in the air and soil can really mess up this hobby.

To WinAPRS users trying to upgrade to 1.1.6

There have been many reports of the fact that the W116UPDT.ZIP file is corrupt. I will be recreating it. In the mean time, download the full version WAPRS116.ZIP, unzip it in a DIFFERENT directory and copy out just the .exe and .dll files.

Sorry for the headaches.

Mark

Often the problem on 2 meters and at the top end of 440, is paging
transmitters in the 152-153 portion of the spectrum. They tend to be
high power, and not so clean. We have recently installed a half dozen
notch filters by made by PAR Electronics, 6869 Bayshore Drive, Lantana
FL 33462 on receivers in a heavily populated site (our EOC), and have
seen a tremendous reduction in intermod and receiver desense. Typical
insertion loss is .3 db within the band, with the bottom of the notch at
-50 db! They're also available through Amateur Electronic
Supply...going
price is about $65.00. They'll handle 50 watts. Tiny too, completely
passive and symmetrical (either port can take the antenna or receiver).

Currently using them on our packet, APRS, a mobile rig, and 2 m SSB
rigs.
Will be adding one to our repeater too (BR/BR duplexers are NOT complete
isolators at these freqs). Manufacturers claim they also help on 440 by
rejecting third harmonic energy from the paging xmtrs. We're

happy with them here!

73,
Gary

Just remove the battery backup for two minutes which will reset the TNC to
factory specs. It's JP6 in a PK-88.

I'd be interested in knowing how to subscribe to the digest as well.  I didn't
find anything what listproc had to offer that indicated a digest was available.

```
Dr. Lawrence W. James has enhanced his MacGPS program to work with the GPS 20
receiver.  The program comes in a freeware version, and a "Pro" version which
is much more sophisticated, but still inexpensive.

You can read about both (and Garmin products for sale) at his Web site:

        http://www.sni.net/~lwjames/

Dr. James can also be reached by Email at

        lwjames@csn.net

I have participated in testing the GPS 20 features of the programs.  They

work very well.

```
HI, yours  on todays aprssig re signing on.. Send the foll:

To join the aprssig send the foll msg to:

     "  listserv@tapr.org"       with following  line in body of msg.

Subscribe list full name:

EX:  "subscribe aprssig Firstname, Last Name."

To get msgs in digest format (all at once about 20-30 a day)
```

```
also send a second message:
      listserv@tapr.org

      "set aprssig mail digest."  or you can send this as the
second line of subscribe message.

To download programs, maps, files, maplists got to foll URL.

  "http://tapr.org/tapr/SIG/aprssig/files/upload"  if this does'nt
go first time break it down by sections: http://tapr.org,    then
extendt addrs,  /tapr/ then /SIG/ , then aprssig/,  then /files/ then
upload. I have had to do it this way several times. Then click
of file u want.

       To quit the sig, send msg to listserv, and text of

    "unsubscribe  aprssig  First Name, Last Name.. "

Hope this gets you on and helps you out.

     73's & Enjoy, Bill/WB6LPG

     In order for the F8 funcction to work with your configura-
tion, several things must exist:

     1) You must have a Validation number for APRS;
     2) You must also have a GPS Validation number for APRS;
     3) You must tell APRS you're using GPS and save a configu-
            ration file for it, and;
     4) You must tell the PicoPacket to use LGEtchar $05 to en-
            able the F8 function.

I hope this solves the problem.  Please note that the above ap-
plies to APRSDos.  I'm not sure if it's the same with The Bro's
Sprouls' product (well, IS it, guys?  I noticed the default in
WinAPRS 1.1.6 for the PicoPacket shows "LGE $00," which is the
factory default.)     73

Jim, KU0G, Kansas City APRS Coordinator, has an excellent suggestion by
his example.   Several WinAPRS users in our Central Florida Area have
indicated to me that it is difficult to see the little blue mailbox in
the lower left corner of the screen at times, especially at a distance.
In applications similar to SKYWARN, where communications are time-sensitive,
this could be a major shortfall to not notice a message.

I have had a number of people ask me "Why dont You answer
Your messages?" I didnt see the little blue box or I had the
program minimized.  I wonder if Mark could add an audio
alert to the Mail alert.  I dont watch the screen all the time
so have a good chance of missing an important message.
So Mark if possible an Audio Alert.

104. Davis Monitor II Feeding two computers?

From: Gary Arnold <garnold@naples.net>
Date: Tue, 05 Nov 1996 14:49:52 -0800
To: APRS SIG <aprssig@tapr.org>
Cc: APRS FL Sig <aprs-fl@tapr.org>
Message-ID: <327FC490.3335@naples.net>
Rendered body type: text/plain

```
Does anyone know if there is a way to retrieve data from a Davis Monitor
II to BOTH WinAPRS and Davis' PCLink software?  Have split the data, and
it appears to work, until WinAPRS polls the Monitor II...then PCLink
crashes back to it's menu screen.

Since the equipment and s/w were purchased by our department for EM use,
with APRS secondary, I need a way to make it work on both.  Tried a
diode matrix on the polling line with no success:

To Davis Mon. II <-----+----|<|-------------------> APRS
                       |
                       |----|<|-------------------> PClink

Does WinAPRS require the ability to poll the Monitor, or can it just
wait for and receive the data as it streams, polled by PCLink?  (PCLink
MUST be able to poll, to download highs/lows, and to archive.)

Any suggestions would be appreciated.
73,
Gary

>                          wa4ikq@nevets.oau.org

I do NOT consider this a "shortcoming" but a feature, it is my
interpretation of APRS that maps are the KEY ingrediant not "keyboarding",
therefore, messages are secondary.  On the Mac it will speak the messages
to you if you set up the voice options.  If you do not have this on, it
behaves EXACTLY the same as Windows.  Windows does BEEP at you and DOES
place a mailbox ICON in the lower left of the frontmost window IF AND ONLY
IF the front most window is a MAP window.

If users would like WinAPRS to be more obnoxious about incoming messages,
then POLITELY ask for that feature, just last week I explicitly asked for
feature requests, but DO NOT call it a "major shortcoming".

I can easily do the following:

        When a message comes in to YOU
        Automatically open the MESSAGE LIST WINDOW
        Scroll down to that message so that it is displayed on the screen.

If you would like this implemented, please let me know by PRIVATE EMAIL,
dont flood the sig. If I only get a few responses that I will assume that
it is not important.  If I get a least 10 response saying they would like
it to behave in this manor then it will be in the next release.

PLEASE PRIVATE REPONSES TO sproul@ap.org

am a casual user of aprs....would like to watch propagation on hf and vhf.

what would be the ideal settings for the aprs program to obtain the most position reports, and not see any relays. i would like to be able to query also. right now am seeing a lot of stations at the screen bottom, but they all dont show up on the map.

i also would wish that everyone put their grid square in their posits....!

tks . ... 73's

Since the 'Ding' of the message announcement comes through the sound board, I expect I could get this to do that on my system too. After all, Windows is merely playing a sound file, on command from the WinAPRS program. It should be just a matter of reassigning which sound file is played.

You want your machine to shout at you? How about the AOL sound file that says "You've got mail." Turn the volume way up before leaving the room and shutting the monitor off.

regards,
Joe kf4dys

Hello David,

If you are using the DOS version of APRS, enter C-F-D (Controls-Filters-Direct) and APRS will only display stations you are receiving directly. See October 1996 QST, page 86 for an article about using APRS as a propagation tool.

73,

Stan, WA1LOU

111. Software for GPS 20 NOW

From: TCox17892@aol.com
Date: Tue, 5 Nov 1996 12:37:33 -0500
To: aprssig@tapr.org
Message-ID: <961105123732_1215224915@emout12.mail.aol.com>
Rendered body type: text/plain

In my original posting on this subject, I said that the GPS 20 is now supported by both the freeware and Pro versions of MacGPS.

I overstated the case: Dr. Lawrence, the author of the programs, has pointed out that the Pro version now works with the GPS 20, but the free version does not.

112. Re: [APRSSIG:6168] Software for GPS 20 NOW

From: clark@tomcat.gsfc.nasa.gov (Tom Clark -- W3IWI)
Date: Tue, 05 Nov 96 17:59:29 UTC
To: aprssig@tapr.org
Message-ID: <3278@tomcat.gsfc.nasa.gov>
Rendered body type: text/plain

```
TCox attributed the MAC GPS software to "Dr Lawrence". I believe the
author is Dr. Larry James, who shows up in the callbook:

> Call-Sign: KG0GB                    Class: ADVANCED
> Previously: N0BRA                   Class: SAME CLASS
> Real Name: LAWRENCE W JAMES         Birthday: MAR 17, 1942
> Mailing Address: 7329 MEADOW CT, BOULDER, CO  80301
> Valid From: MAY 25, 1993            To: MAY 25, 2003

FYI -- Larry is probably the most reptuable Garmin dealer (operating out
of his home). If you need any Garmin widgets, call him at 303-530-9014.

To: aprssig@tapr.org
Message-ID: <199611051918.OAA03834@blackdog.sw.stratus.com>
Rendered body type: text/plain

```
About a year ago I ran across the problem with the KPC-3 where it would start
transmitting and seemed as if it wasn't going to stop. After talking to a
number of people here on this mail list I concluded that at 0000Z it would
send some data over and over again for 1 minute and would then stop. The
problem is that there is a bug in the 6.0 firmware that supported GPS. If you
press Kantronics they can supply a new EPROM to fix the problem.

So everyone that is seeing this probem no check the rev of the EPROM and call
Kantronics service about it.

Message-ID: <3280041E.7223@cyberenet.net>
Rendered body type: text/plain

```
To easily unsubscribe,

You need to S-A-V-E the confirmation messages you receive from various
list servers. You know, the one that you received AFTER you subscribed.
The one that has your default password in it. The one that tells you HOW
TO UNSUBSCRIBE.

Just make yourself a folder in your mailer and save these type messages
in there. Then when you need to refer to them they are handy. If you
don't/can't/won't do this then print out these MSG's to paper and hang
on to them.

unsubscribe <list>
```

```
signoff <list>
------------------
Two ways of removing yourself from the specified list.

[the list IS NOT aprssig, its listproc@tapr.org]

YOU MUST DO THIS FROM THE MALBOX/USER ID THAT YOU USED TO SUBSCRIBE,
else it won't work!

73...Bob

```
Thanks to all who replied to my request for information. I appreciate all
the assistance and advise.
        To summarize the posts and private messages I have received;
If you are looking to filter out commericial services from a variety of
sources, the Band Pass filter by DCI is the way to go. I have heard *NO*
bad things about the filter nor the company. (By the way, I ordered one
today, to be installed this weekend [I hope]). I was very impressed with
the Technical assistance I received from the DCI staff. I was asking about
6 & 8 pole filters, and the company rep told me that while he would be
delited to sel lme the more expensive filter, he felt my situation would
be well suited to the less expensive 4 pole filter. I like honesty.

If you are trying to notch a signal from a specific source (I.E. a known
frequency) then PAR Electronics sells a notch filter that received many
glowing reports. (I didn't look in to this option as we are trying to
prevent mixing of several frequencies in the front end of our repeater).

        Once again I wish to thank all those of you who have taken the
time to respond, and those of you who tolerated my use of the bandwidth.

*** I dont have a clue.  Try it and see, hi hi

> Also, the W E dir/vel/etc etc was set for their reading of 14.5 MPH wind
> velocity and the transmitted report showed 4.5 mph.

*** APRS only supports a 3 character wind speed.  14.5 is 4 characters
and so the rightmost 3 are used.  So you can enter 9.9 MPH but you cannot
enter 10.9.  Best to raise that to 11...  In otherwords must be integers
above 9.9 MPH>

> Question: Does the C X command inhibit manual xmit commands such as X A?

*** No, Manual trasnmit commands will alsways transmit

Does anyone have first-hand experience with the Garmin GPS-31 "TrakPak"? This
is a integrated receiver/antenna that's designed to be used with a PC (no
display). It appears to be about the size of the Garmin mag-mount external
antenna, which makes it very small indeed (about 1.5"x3"x.5").

I've seen this thing advertised on the http://www.navtechgps.com page, but have
not seen it discussed here. Not taking away from all of TAPR's efforts on our
behalf with the GPS-20, but it has to be noted that the $229 price of this
combination receiver/antenna with serial output makes it awfully attractive for
APRS application. The integrated configuration seems like it would solve
several problems simultaneously - especially the antenna issue (not to mention
that *&%# MCX connector <g!>).

Any thoughts?

Mike:

I have had one on the dash of my Jeep for about six months. Works great!
It also has two serial data output lines which will allows you to output
to your TNC and to a PC or J. Harper's display kit.

I have first-hand experience with Garmin's GPS-30 which is also a
combined
GPS receiver and antenna in a waterproof housing shaped much like a
computer
"mouse". It has about 12 feet of cable attached and, for APRS use you
need
to use only 3: Power, Ground, Data out. Perhaps the GPS-31 is a
fancier
version of the GPS-30.

Regards,
  Will, N3XLM

I have (and use) trackpack 35 units (the 12 channel  parallel tracking
version that looks like a computer mouse).  Mine feeds right into the 2nd
port on a Picopacket. They work fine, even in an airplane or helicopter and
even in an L1011 at 35000 ft and 400+ MPH.

They use at least one on the Brothers To The Rescue Flights.

The performance makes the cheap marine 1 or 2 channel sequencing Garmins
look like a cheap toy.

Beware that the Trackpacks with a 9 pin PC serial connector DO NOT bring
out the DGPS input.

Not sure exactly what engine the the 31 uses, probably a Trackpack version
of the gps-20 (or even less).   Mine is the Trackpack version of the GPS-25.

This should work, you need the TRANSMIT data from the davis to go to the
PCLink port, NOT to WinAPRS, WinAPRS really doesnt care if the Davis hears
what it has to say, it is only telling it to output data, I am sure the
PCLink software is doing the same and when the data comes in, WinAPRS
should deal with it just fine.  NOTE: I have not tried this so I am not
making any promises.

Rendered body type: text/plain

The response to my suggestion for the new method to handle incoming
messages was VERY good. I have it implemented and working just fine. I
also fixed the bug that caused reply to go to the wrong address if anything
but ALL MESSAGES was selected. The next release, version 1.1.7 will be on
Thursday of next week (the 14th). There are some MAJOR weather display
improvements plus several minor bug fixes etc.

I also have the "FIRST" step, but not finished, for proto path selection,
this is a window that displays the path that each station has. Its by no
means really implemented and at present its just a window that you can look
at, it doesnt do anything other than show you the path for each station.

So far the response to my request for input on features has been going
well. Most of the requests have been quite resonable, there have been one
or two out in left field and there was one that was very good and very well
thought out but would require my working full time on it.

The response to this message window has also been very good and everyone
has responded directly as not to flood the sig.

Mark

This is a key condition. Those of us who have been moved to a different DNS
are stuck on this list because `unsubscribe' and `signoff' do not recognize the
new DNS portion of our e-mail address. Those of us behind firewalls can have
a problem as well since our return e-mail address may or may not match the
`MAILBOX/USER' in the very message that we used to subscribe.

Good Luck!

134. TAWG FALL APRS CONFERENCE 1996 SUMMARY

From: AH7E@aol.com
Date: Wed, 6 Nov 1996 14:19:12 -0500
To: aprssig@tapr.org
Message-ID: <961106141911_1417206328@emout11.mail.aol.com>
Rendered body type: text/plain

TAWG FALL APRS CONFERENCE 1996 SUMMARY

On 26 OCT 96, the Tri-State APRS Working Group (TAWG) sponsored the Fall APRS Conference. Approximately 25 people attended.

After an explanation of the TAWG organization by Sid, AH7E, Mike, KB8SSH, gave a demo of APRS and WinAPRS. Discussion about the proper use of the path settings helped some of the folks new to APRS. Many other questions were answered in reference to general APRS operations.

Joe, W8RIK, showed an informative video about GPS.

Joe also moderated a discussion about APRS□s use with the National Weather Service and ARES. Tom, KA8ZNY explained some of the newest improvements in the Cinci-Dayton-Columbus 19.2 k network. Tom explained how the different Skywarn groups will be linked to the NWS in Wilmington, Ohio. Tom explained how the 19.2 network was working on passing RCM data through the network. APRS is expected to be the next project for the 19.2 network guys. If the 19.2 k network plan work, changes may have to be made to our paths for the APRS weather stations. More information soon.

Doug, KB8GVQ, explained a project he has been working on over the past few months. Called the Standalone Tracker Interface (STI), Doug□s device may interest those of you that go APRS/GPS mobile. Among many of the bells and whistles, the STI has a speed controlled beacon. Doug observed a problem with all the packets flying around from parked vehicles sending out too many packets. Doug□s device controls the beacons with information from your GPS. The STI is set up via a computer port. The STI works with any TNC. Doug also has some 30 watt radios on 145.79 MHz for sale. These radios have been taken out of commercial service and put on 145.79 MHz for APRS use. Doug can be reached at baded@nacs.net.

In an open forum, the group discussed many items:

The need for a better interface between TAWG and the NWS/Skywarn folks was discussed. The need to inform/educate these people about the benefits and abilities of APRS and the APRS weather stations were points brought up by the group. Mike, KB8SSH, and Tom, KA8ZNY volunteered be the committee to start on a plan for working with the NWS and Skywarn groups.

Ryan, N8YHV volunteered to be the TAWG "WEBMASTER". Ideas about a web page, Digi/gate database and other Internet related projects were discussed.

The group also decided there was a need for a Network committee. Interested parties should contact Sid, AH7E, about helping with the committee to improve our TAWG network.

Eric, N8FYD gave a presentation and demo of his new project, the Electronic Routing Information Companion (ERIC). Eric has come up with a product that attaches to your Garmin 45 GPS and gives voice announcements for the waypoints you set in the Garmin 45. Vacation trips can be input and ERIC gives proper warning of interchanges. One of the more interesting spin-offs from Eric□s work on ERIC, is he has come up with a way for APRS stations to be plotted on his Garmin 45 screen without a computer. Eric hopes to have his product available in kit form soon. Contact Eric at jfrancis@magnus.acs.ohio-state.edu for more information.

Thanks go out to the following people for their help with the TAWG Fall Meeting:

Joe	W8RIK
Mary	N8TBO
Mike	KB8SSH

Respectfully submitted,

Sid

AH7E

Sounds cool. I'd thought about doing a similar thing, taking posit
reports and send them to the Garmin 45 as waypoints. It's nice that the
Garmin allows 6 charaters for a waypoint name, just the right size for a
callsign, though no SSIDs are possible.

136. APRS Activity in area?

From: kb8qir@westco.net (Jacob W. Tennant)
Date: Wed, 6 Nov 1996 15:22:07 -0600 (CST)
To: aprssig@tapr.org
Message-ID: <199611062122.PAA24988@tapr.org>

Hello,

I am located in Morgantown,WV (3939.0N 07959.40W) and I am looking for any
active aprs operations in the
area since a search of the local groups have found that there is a couple
people interested but nothing
really going on.

Also, any advice on getting started in APRS would be greatly appreciated and
used constructively.

73's Jake, KB8QIR

>
> Mark
>
> ____

Mark's right! It does work as we thought. Takes some tinkering, and a logical startup, but it appears to work. Here's how:

1: Be sure that there is NO CONNECTION between pin 2 of the RS-232 (25 pin) of the WinAPRS computer and the Davis equipment. We use an RS-232 breakout box, all pins jumpered from one side to the other. CUT THE TRACE ON PIN 2, at the WINAPRS side of the breakout box. Verify that the trace is cut with an ohmmeter.

2: Connect a three wire shielded cable to the break out box circuit board, so that Pin 2 goes to Pin 2 of the 25 pin RS-232 connector on the serial port of the PCLink computer, and Pin 3 goes to Pin 3 of same. Use no diodes or anything, just a straight connection. Connect Pin 7 on the breakout box pc board to Pin 7 of the PCLink computer (this is SIGNAL ground). Solder the shield to pin 1, ON ONE END ONLY (to avoid ground loops). Pin 1 is FRAME ground.

3: Start PCLink, and verify the serial port is working, with (S)etup, Seria(L), and (T)est. If so, go back to the menu and start the display with (B)ulletin, (Y)es. The s/w should download highs and lows, and start the display. (**You may want to (D)ownload the archive and save it before starting the display.)

If the serial link is NOT working, double check your work, and try again.

4: Start WinAPRS, setting the ports, and opening them as usual. Open the Weather Display, and sit back. Within a couple of minutes (no more than 3-5) the display should be updating nicely.

PCLink polls the station regularly, causing data dumps. WinAPRS eavesdrops and grabs the data as it goes by. Incorrect frames are tossed away...correct ones update the system!

We also use short haul modems, or line drivers, to carry the data from the 8th floor of our building to the first floor EOC. The short hauls are powered by the computer on the lower end (Pin 2 provides the power!). Upstairs, the Davis equipment does NOT provide power (at least the Monitor II...Davis tech support says the newer monitors do provide power through the serial port.) and the short hauls do NOT work without power on both ends. Simple solution.

Take another breakout box (we used Radio Shack 276-1403, page 168 in teh '97 catalog for both), again jumper all 25 lines from one end to the other (they aren't all needed, but it's easier to just go ahead and use them all).

Connect a clean source of 12 volts to the PC board...positive to pin 5, and negative to pin 1. Secure it, plug it into the line, have a ball!

The usual caveats apply...if you're not comfortable with a soldering iron (don't even THINK about using a gun!), and you're queasy at the thought of messing with your computer's innards through the outards, find someone who's fearless to do the work for you!

It works here...and should work there too, and SHOULD work with the Bob's DOS version! Thanks for the clarification on how (little) WinAPRS must manipulate the data Mark!

Sorry this is a bit long, but figured it might save several hundred dollars for those who need both displays, but don't want two full systems!

73,
Gary WB2WPA

I too had been thinking about this. Question: Is it possible to send
a serial command to the GPS-45 to REMOVE a waypoint when it is no
longer needed?

Regards,
Will, N3XLM

am interested in monitoring aprs on vhf for propagation study, would like to
see a list of any digis say within
250 miles of Washington, NC. grid fm15mm.

also would like to know what setting would be necessary in the aprs program,
and what settings would be optimum
in my tnc to glean max info. (mfj 1278b) would also like to monitor
propagation on the hf bands.

also, anyone like to do some ms on 6/2/10m using aprs?

tks . ... 73's

Has anyone had any experience with external antennas and the Garmin GPS-40?
It's a nice unit, but around my area, it's very hard to use inside a vehicle.

The paccomm active antenna for about 50 bucks (really a Trimble), is a
steal. It peforms perfectly with the 40. You do have to put on your own
bnc...it comes with an SMB or SMA (can't keep them straight). Lots of
people I know are using it and Gwynn is providing them to the amateur
community at a significant discount. It is a tiny magmount antenna, like a
very small hockey puck. Must be mounted on a metal surface or it won't
perform. 73, hasan schiers, N0AN--

Not so! I tape mine to the top of my riding helmet when trail riding and
it performs just fine.  By the way, the price is now $65 + s/h. The $50
was an introductory price.

You must be one of those guys with an old war injury and have a metal
plate in your head...that would 'splain it. (my sorry attempt at sick
humor)

Or maybe a distant cousin of Craig "IronHead" Heyward (NFL)?

Garman's external antenna, model GA 27, made for the GPS40 has a MCX
connector, whatever that is. You may want to consider that antenna because
of the connector. Check out www.navtechgps.com. They have it. It's more
money than the trimble but does have the proper connector. I have the
trimble antenna from Paccom on my Garmin GPS 90 and it works great. I used
an Amphenol 31-315-RFX crimp-on BNC for RG-174 that works fine with it.

If you have access to an FM receiver or downconverter that will permit you
to tune a weak signal in the 250 to 260 MHz range please let me know.
WIth it, you may be able to track our two GPS chase vehicles on the
evening of 6 December during the annual running of the Army Navy game ball
between Annapolis and Philadelphia (128) miles.  You dont have to be on
the East Coast to participate.
```

156. APRS Pacific Station

From: bbliss@juno.com (William B. Bliss)
Date: Thu, 07 Nov 1996 18:10:13 EST
To: agibbons@gatepoly.co.ck
Cc: aprssig@tapr.org
Message-ID: <19961107.142754.2303.0.bbliss@juno.com>
Rendered body type: text/plain

```
Hi Arnold/ZK1DB
   Copied yours off aprssig 11/1/96..

Am a west coast APRS HF gateway station on air daily,
located 2 blocks from Pacific Ocean 3727.39N/12226.29W
Half Moon Bay, Ca. just south of San Francisco. Run only
100w Knwd TS440at, with Kam Plus+, into an Inverted V, cut to
30M about 25' high at center. If the solar sun and propagation
allow you might hear me occasionally up on APRS. Usually from
1500Z thru 0400Z (7AM to 9PM PST). I could get on air about
12-1300Z (early AM) if you think it would help.

We had some Hawaii stations up on APRS (0200-0300Z)
WH6YC/DAVE but he is in Washington state now, and don't know
if any other Hawaii's that are on now.

I sent an APRS Disk to Jim/KE6RK S/V Heart of Gold, back in
Aug/95 and some packet messages about APRS. They were in
Naiviivi Bay, Qamea, Fiji at the time. Never did get an
acknowledgment of receiving the disk, nor any more packet
info msgs from them via Pactor station W7DCR. They mentioned
your amtor MBO and call in one msg. This all last year when
the WX FAX broadcasts were going off air. Their back now.

We do have one APRS MAP "PACSOUTH.MAP" within MAPLIST.HI centered
posit 19.27S/142.45W, which includes Cook Isl., Societies,
Tuamotu, Australes, Marquesas, so look for that map of your
area. Map made by Ken/W7KKE and am sure he would make some
specific smaller local area maps, if we can get some charts of
area you mite want if on his USGS CD-ROM disk. Or we could get
some maritime charts.

Send me the Pactor frequencies you operate on, and specific
times can try and QSO with you. Also FYI, KG6DV on 14065 has
a MBX set up for Maritime Mobiles, and you may be able to QSO
with that station, am told has good coverage throughout the
Pacific, many MM2's drop their traffic their. Also listen for
Bill/KB6LFM (here in SFran area) on 14065 quite often after
1900Z..They are not on APRS however.

Do you have access to the tapr.org to download APRS files,
versions and maps. Can help you out and mail you disks if
necessary, send me your mailing address. Any other type of
help, let me know.
    73's & Enjoy, Bill/WB6LPG@KE6WVQ.#NOCAL.CA.USA., or
bbliss@juno.net or wbliss@coastside.net

```
I have just bought GPS-20 from TAPR, and Trimble antenna. After
connecting both units together I am getting everything out exept my
position. I have tried  power on for about 3 hours and nothing. My $GPGGA
sentens is giving me only time and space for position but no position
yet. I checked my antenna it's taking about 20mA from the GPS but why
I am not getting any position? Off course I had a problem with the
connector and still this is not solved. Does anybody know what is wrong
with my GPS? Where can I buy connector for GPS and Trimble antenna. I
will appreciate any advise or suggestion.  Thanks, Robert KB2PNM.

You may need to power on and off a few times.
SEE several old postings about this.

1. what power supply are you using ?

2. Test with a version of APRS or the sigplot basic program if
   you are a dossie ( I am a MACcie :-) I am a WINnie also
   but not because of a computer platform.

3. You have got to do #2 so you can tell us the sig level you see.

4. If you watch the APRS sky map "all will be make clear".

I am leaving in am for AMSAT conference, so I cannot answer all the email's
I have received directly.. I will when I get back.
        I have 25 GE CENTURY II xtal controlled 30 w 144-174 capable radio's. they
are one piece 12v dc. radio's. I can provide as is on 158 mhz, as-is with
xtals
and/or tuned on freq. 10-15 working days for xtals. I am a tech, but they
are mine personally. I will sell at 75.00, 100.00 and 125.00 in the above
conditions. 1200 baud, and seem to even be able to do 9600 with tweaking.
They are not for plug and play, off the shelf type's.. they are commercial
```

with commercial narrowband specs.
 good imunity to IMD etc. but were not delivered for ham packet radio.
Connectors
need to be crimped, molex type inline connectors. Docs available, manuals
may be copied for those who need . They are not cuurent, and I do not
beleive factory info is still avail. Very serviceable by local ge shops,
they were simple radio's to use,and maintain. I may be able to provide
radio to tnc cables for addt'l charge for those who need.
        PLEASE private email if you need further info, Sorry for using the
bandwidth. These are a personal project of mine for APRS, and packet, I
hope they will be helpful at this price..
        As for My Stand Alone Tracker Interface, more details when I get back next
week. basically it is a stamp II project that intercepts gps data to tnc
and modifies beacon timing in 5 steps from 30 sec's to 20 mins based on
speed 0-100 mph. It has tactical callsign, APRS symbology support, set able
unproto, and Legal ID call sign/free form id.. Parts available for advanced
builders now, kit in future for others... stamp in raw form prog. 65.00 +
shipping., kits will be more.
hope to do my own ax25, and remove need of tnc for radio interface. I have
operational prototypes at this time.. Hope to make easy flash type code
upgrade
available in future. BTW they are user programmable with above options ...

162. registration

From: ke6nyt@fishnet.net (Dan Dicke)
Date: Thu, 7 Nov 1996 22:56:19 -0800
To: aprssig@tapr.org
Message-ID: <199611080656.WAA05178@big.fishnet.net>
Rendered body type: text/plain

A couple of weeks ago, someone asked if he could register on the net with a credit card and I never saw an answer. I am the packet Coordinator for Ventura County Ca. ARES/RACES and I am trying to get started in APRS so that we can use it for our events. I want to register the software and for the GPS side also. I have 77d or whatever, so I don't need the files. I am going to Vandenburg Air Force base 16 and 17 November for a search and rescue symposium and we are going to discuss and use APRS for the drills that we will do on Sunday.

Thanks for your time.

73
Dan Dicke
KE6NYT@FISHNET.NET
(805) 983-1401

PS. When I run APRS, I see stuff in San Diego and a WIDE in Pasadena, but I keep getting packet not acknowledgeed or seen or what ever the error is.
Any IDEAS?????

Date: Fri, 08 Nov 1996 09:32:29 GMT
To: aprssig@tapr.org
Message-ID: <225187@tmrelay.prod.phonelink.com>
Rendered body type: text/plain

Even this length of time after it's introduction, I'm still having great difficulty (read "impossibility") in obtaining a PicoPacket in the UK to the specification which I want (dual port, with battery pack). I'm particularly keen to use a Pico since it needs to fit into the space in a portable APRS / Ultimeter / GPS45 / TNC / radio unit which was formerly occupied by a Handipacket - any other TNC is going to need a fairly major redesign, and may not allow space for all the items.

Is there anyone on the SIG who might have a Pico to this spec which they might want to sell, or even anyone who might be visiting the UK in the next couple of months who might be interested in bringing one over - think how you'd be helping spread the APRS message in the UK and Europe!

I'd also be very interested to hear any comments from anyone using this spec of Pico, particularly anyone who is also using it with external modem for 9600. Replies to epu@wmfs.telme.com   please, not via the SIG.

Thanks!

Bob, G8IYK

166. local 32 mile radius map

From: ke6nyt@fishnet.net (Dan Dicke)
Date: Fri, 8 Nov 1996 07:53:43 -0800
To: aprssig@tapr.org
Message-ID: <199611081553.HAA13668@big.fishnet.net>
Rendered body type: text/plain

Bob,
  On the registration form, there is a Local 32 mile radius map similar to
the quality of a state highway map. I take that as it will show the
highways through the area and not all the streets/roads? We are trying to
get Ventura County, Ca up and running in APRS. I am the ARES/RACES packet
coordinator for the county and I am trying to get things rolling. We have a
lot of mountains and hiking areas in the county, and I wanted to know how
detailed the map was, to we=hether or not we should get one for the laptop
in our emergency communications trailer or not.

I mailed my reg and GPS reg today. I hope that I can get my validation
number soon. We are having a search and rescue symposium on the 16 and 17
of Nov at Vandenburg Air Force base that was a lot of fun last year. We are
going to have a class/presentation on APRS on Saturday, and then try to use
it on Sunday during the field exercise. Any input is much appreciated.

APRSdos REPLY/COMMENT:  I make those maps from the 2,000,000 scale CD ROM
and most current APRS distiributions already have maps to that scale.  So
you wouldnt gain anything.  Contact your Calif APRS map coordinator to see
if better maps exist for your area.  He is W7KKE in Foster CIty, CA.

I am running DosAPRS.  Most of the time it is on a 286 portable at
home.  When I go portable, I use a Pentium Win95 laptop.  For some
reason, it runs different in Win95.  When I press "S" to send a message
or F2 to reply, a dialog/help box keeps appearing and replaces the map.
The info was helpful the first time, but I don't need it everytime.  I
like the way it works in Dos with just the line at the bottom of the
map.  Anybody got an idea why this is happening?

Message-ID: <3283CE3F.1952@concentric.net>
Rendered body type: text/plain

```
Since packet as a whole is dead in Madison county of North Alabama, and
i'm no longer running APRS I have several TNC's for sale or trade, the
list is as follows:

(2) KPC-3's with GPS, I believe the latest rom's
(1) PacComm Handi Packet, Also the latest rom's i believe, battery in
    good shape.
(1) PacComm Tiny-2 MK-2 Also with the latest rom i believe.
(1) DRSI DPK-2 Does not have the GPS function.
```

```
The Handi Packet can come with a ready made cable for a Alinco DR-1200.
The KPC3 can come with a ready made cable for a Alinco DR-130.

If interested, make an offer. Please e-mail private and not to the sig.

Hi All,

On Fri, 8 Nov 1996 William Nolle wrote:

>Since packet as a whole is dead in Madison county of North
>Alabama, and i'm no longer running APRS ...

Aw, c'mon Bill. We all know you've got thicker skin than that. Just because somebody (I'm sure) temporarily locked you out is no reason to throw in the towel and give up! Be bigger than that and stick around. Your input here and as a knowledgeable APRS operator in your local area has been informative, even though it's occasionally somewhat less than totally courteous at all times ;-{)

There are plenty of people that would be glad to see you pack your bags and crawl into your little shell but I'm thinking of all the hundreds of maps you made for people, all those who wanted to subscribe (or unsubscribe) to the SIG whose hand you held and led in the right direction. And what about reams of valuable advice and information passed right here on this SIG, not to mention the many people who've found APRS help via your web and mentors' pages? You may not be universally appreciated but I, at least, count your participation here and on the air as a valuable asset to APRS ... one which we all would be worse off without, despite the ribbing, flamewars and arguments. Without conflict we do not grow as humans and this is the nature of the human condition.

So go and sell your TNC's. Resign from the SIG. Remove your callsign from the digital domains of the airwaves. While you're at it, donate your H-T's to a local ARES/RACES group. Pick up a few bucks for the HF rig and, just for good measure, take the good VHF/UHF multi-mode, kilobuck rig and take an axe to it. Yeah. That'll make you feel REAL good!

Fer cripes sake, stop wallowing in what is obviously self-pity and rejoin us here. You have value to most of us and your self-imposed exile will do nobody any good, especially YOU!

And to all those who'd say to Bill "Good bye, and good riddance," try to look between the flames to see some of the gems Bill has bestowed on us in the past. His Web page has given us many new operators. His Mentors' page have given THEM someplace to get a good start with APRS.

I remember an old saying: "If you have nothing nice to say, don't say anything!" This goes for Bill's naysayers as well as for Bill! This is supposed to be a forum for the advancement of APRS knowledge, theory and ideas, not someplace for some of us to throw rotten tomatoes at each other. If you insist on engaging in flame wars then, by all means, WRITE the flame. Then re-read it the next day. When doing so, put yourself in the other guy's shoes. Some other guy with real thin skin. See how YOU'D feel if you were the recipient of that message. If you still feel the same way, send it via PRIVATE e-mail. Don't air your dirty laundry in public. None of us want to waste our time reading such trash, as that's not why we're here.

We're on the verge of losing a valuable asset to the SIG based on a few individuals' pettiness. Shall we sink to the level of the usenets? Or shall we be grownups about it?

Okay, I've got my asbestos breeches on. Ready for any takers. I'm usually a little more genteel than this here on the SIG, but feel strongly about this. I'm the first to agree that Bill sometimes grates on the nerves, but he serves us as best he can. How's about it? 73

To followup on this -- we just generated a new page in the TAPR GPS area
that discusses building three different power supplies for the GPS-20.

We are discussing doing a simple board now that takes either the 7805 or
the powertrends module to have available for those that want a simple to
build solution. If you havn't looked at it, the Power Trends allows you to
run off batterys. Very nice solution.

The web page is:

Thanks Robert for your suggestions, I will try to do few on-off tricks. I
am using ICI 7805 that is giving me 5V from 5-30V (I am planing to use
my GPS as a Tracker from the car).
Thanks again and I will let you know if those tricks work in my GPS. 73

Rendered body type: text/plain

```
Bob-

I just returned from another road trip. (met some nice Houston-Clear Lake
area APRSers too). I leave the computer on while I am gone, because I send
U-II info into the local APRS network.

I had a screen full of messages from other users who thought I had been
home. No telling how many people had gotten REJ messages as well.  One user
was apprehensive because he thought I was ignoring him as well.

What about a phrase we can enter that is automatically sent back in
response to a MSG (not a BLN).  It would be like the Vacation Message that
Internet providers let you set.  If I received a message, it could log the
msg in the log and then send the prepared phrase.  I would have used  "Will
not be at terminal until 11/6. Pls try then" or something like that.

This way folks know you are not ignoring them, you just can't see them
right now.

Thanks

Message-ID: <199611091337.IAA21855@mail-e2b.gnn.com>
Rendered body type: text/plain

```
Hi All,

     PaccComm has done it again.  As many of you know, they are
one of the few manufacturers that are responsive to our needs &
requests (quirky as they sometimes are) than some of the larger
companies out there.  We wanted small TNC's, they gave us one.
We wanted one with a second serial port for our GPS, we got it.
We asked for one with a built-in GPS unit and they responded.
Their products seem excellently made and do well that which
they were designed to do.

     I own a PicoPacket with the built-in Trimble S-vee Six GPS
receiver, which was only programmed to give APRS $GPGGA strings
(which makes mobile use a bit less handy.)  I had to send it in
for a minor part replacement (the voltage regulator) and was in
touch with Gwynn Reedy, who monitors this SIG.  She said they
```

```
were about to start a retro-programming of existing units to
let them output $GPRMC and $GPVTG strings, this giving us the
course and speed information.  This is being done at a break-
even cost of (she estimated ... don't hold her to this!) about
ten smackers plus postage.

     Well, I got it back the other day and am pleased to report
to you that there's this little box below the cursor box in the
upper left hand corner of the APRSDos screen that, even as I
write this, am seeing that my QTH is supposedly moving 4MPH on
a course of 206 degrees, which I attribute to SA.

     Now if only somebody in the New York City/Tri-state area
would start giving us DGPS strings like WB3V in the DC area...

Amen-

I just got my response back for the suggestion to Kantronics about having
the posit rate of a tracker slow down if it was not moving.  They said (and
I paraphrase)

The TNC doesn't process the string
It just stores and then beacons it
It will not do what we want.
and they did not say they were interested in changing it.

I guess maybe a TNC Co. who specializes in Vehicle Tracking would have a
more positive answer   ;-)

Kudos to Gwyn, Linda, and the rest for putting up with us!

Ralph

Agreed. However, if the text is supplied by the user, you could simply
make it report "I am away from the terminal" and let it go at that.

Also, an op that's away does not mean the house is empty..

Well, don't go advertising that fact then. Just like an answering
machine... you simply say that you're unable to answer their message
right now as you're away from the keyboard. No need to say HOW FAR
FROM the keyboard you are, right?

If you really feel compelled to give an excuse say you're "enjoying the
privledges of marriage at the moment. One of us will get back to you
after we're DONE. That may be some time from now..." :-)

APRSdos REPLY/COMMENT: Because in your area, you pick up another 96
stations and they bump your off the bottom of the list! Maybe.

If you put a "TRACK" on an object, then it will NOT bump off the list. Im
not sure if that would work for an object, but you might try...

Message-ID: <9611101611.AA10343@wtpprod1.wtp.net>
Rendered body type: text/plain

Greetings from Montana,
Now that forest fire season is mostly over, I have been thinking
about
how APRS might be used to help fire crews during a fire. So this
brings up a number
of questions.
First, Would it be possible to generate 3-D maps for use by APRS.
In
mountainous country verticle distance is just as important as
horizontal distance.

If 3-D maps could be generated and displayed in APRS one could track
fire crews
and the fire line, as well as weather info., in a very meaningful
way.

        Second, I did see some discussion of miniturized gps/tnc/HT setups
earlier this year, but was too busy to keep track of them. So, I
was wondering if
a small package could be assembled that could be bundled with an HT
that
some of the firefighters could carry. This would allow the fire
boss to know where
his crews were at any time. Similarly he could track his heavy
equipment too.

        My GPS is an Megellan Meridian XL. It outputs either RMC or GGA
NMEA data, but not both at the same time. I notice most folks on
the APRSSIG
are using the Garmin brand GPS. Would this be a better choice?
        My TNC is an AEA PK-12 and seems to function adequately for APRS
but I gather Paccomm makes a miniture TNC which might be a better
choice.

        Comments and suggestions would be greatly appreciated. I would
like to get something packaged up before the 1997 fire season starts.

Rendered body type: text/plain

Hi All;

I received quite a few private replies to my letter of Oct 26.

To summarize, two people wrote me about noise problems interferring with
the operation of the KPC-3. In both of the situations, the transmitted
packet was being corrupted by noise. Also, I received no letters at all,
addressing the scrambled serial port protocol.

In my case, the TNC was not able to read most of the received packets,
but when it did read one, then the transmitted packet was just fine.

Since the KPC-3 is widely used in the APRS community, the lack of
reports leads me to believe my problem was relatively rare, if not
unique.

To those who sent me suggestions, I tried to reply privately to all of
the letters, but in case I missed any, Thank you.

Regards,
Joe kf4dys

Hi Bob;   11/10/96

Nice package you put together. I'm having fun and some success with the
shareware
version of APRS. I just ordered the full package and some features. After I
mailed the
order I spotted the interface option to the DeLorme and other map packages. If
the price
is close to the $34 mentioned in the help text and you are willing to take the
risk. Please
include it and bill me. If not please forward the information to order it.

The TAPR.ORG site has lots of information as you've probably allready noted.
The other good site to look at is Tom Clark's ftp site:

"ftp://aleph.gfsc.nasa.gov/GPS/totally.accurate.clock"

His "Showtime" program works very well!

Garmin will have a Web site in the next few days (or so they promise).

I have a GPS-20 up & running with the Trimble antenna.  If you have any
questions I will try to help (but I'm new at this also).

Message-ID: <32866F03.65C1@worldnet.att.net>
Rendered body type: text/plain

```
I have just received my new vanity call and am attempting to update my
APRS.  I started APRS and it came up with my old call.  I did I(nput)
M(y) and entered new call, position, etc., as prompted.  Told it to
ATL-S, S(ave) and entered my validation number.

APRS will not save my new configuration. When I start APRS, it comes up
just as though I am a new user.

Is there something on the distro disk I got from Bob Bruninga that
associates my call sign with my validation number?  That is, it thinks
that V#xxxxxx belongs to K4FPT, my old call, and it will not save
because that V# is not associated with W4HH, my new call???

Thanks for any assist.

Rendered body type: text/plain
```

```
Using many versions, and now 7.7C, my computer locks up with a RED band
across the screen with parts of a packet showing.  The remaining
information is related to digi/WX station in Northern VA.  I don't know
if the data sent by that station is the cause, or the packet just before
it.  It usually shows ERROR 6, and sometimes ERROR 5 has been seen.  It
happened 3 times in 15 minutes Sat.( 9 Nov) in the morning, while
watching the screen.  Most of the other activity was DX thru a GATE
someplace.

Any ideas what is wrong?  Using a 286 with co-processor and 1 meg RAM.
The computer runs 24 hours a day and the logs/lists (L) screens are
always full at the limit as a registered user.

By the way, anyone know how to pinpoint who the GATE station is?  I see
the packets via GATE, WIDE*.  I am in range of four WIDES, some more than
75 miles away.  I don't seem to be able to connect to the GATE via WIDE.

The REAL path a packet takes when aliases are used makes it as
transparent  as this internet stuff.  It goes in one end and comes out
the other, but it might have gone the wrong way once or twice in the
process.

Rendered body type: text/plain
```

```
Hi "Newbie"-

By the way,  what is your name and call and where do ya hail from?
All we see is Dayglo

A stand alone tracker (which is a GPS, TNC, and Radio)  is really meant to
use a TNC.  The TNC can tell when the channel is in use and hold off from
transmitting.  There is a device called a MIM which is the transmit part of
a TNC plus timing and ID stuff.  It is tiny and can be put with your GPS
and radio to do what you want.

It does not listen, but you can (and should) feed in a "busy" line from the
radio to prevent the MIM from transmitting.

If you download the APRS program, there is a readme on the MIM  and the
designer (William Clements) is on this SIG and will probably answer you
with a much more informative answer than mine.

The Paccomm Pico-Packet is a TNC that is really tiny and is much more
usable for APRS if you *ever* plan to hook up a computer.  It functions as
```

```
a regular, manned, APRS TNC when the computer is present and running, then
reverts to a nifty stand alone tracker when the computer is not there.
That is what I use.

There is a MIM-like device called a Mic-Encoder that allows you to hook
your GPS to your voice radio and run APRS on a repeater.  This requires the
repeater Guru to add some equipment on his repeater, but is an option.

The APRS software is very powerful and makes a nice addition to any
vehicle, but sometimes "ya gotta use a tracker"

You don't need a computer in your car, but you DO need a TNC. You cannot
run with just a radio and a GPS.

"3D" maps ... the USGS provides elevation data for the US "DEM" data. In the GIS industry, use of
elevation data derived from surveys or stereoscopic satellite images, or, more recently, from processed
synthetic aperature imaging radars and/or "IFSARs"  are the means to obtain elevation data bases. There
are several public domain and lots of commercial packages which display elevation data. And, for the
SARs, the data can include man-made features (structures).

I agree, I would not like to advertise the fact that I was not home

Mac/WinAPRS never rejects messages, they always are entered into the
buffer.  When the buffer fills up, the first have are deleted EXCEPT any
messages to you, those are NEVER deleted, so even if you were gone for a
month, all of the messages to YOU would still be there, the rest of the
traffic would be gone but you could read yours, date/time for each message
is saved etc.

Mark

You have to have a TNC to packetize your data.  You can then set it up
with your computer/software, then disconnect for a stand alone tracker.

For Dayglo and the SIG, in response to your query. You can operate w/o laptop in car, but you will need a TNC, in addition to the HTX-202 and Garmin GPS you mentioned. PacComm makes a couple nice small units similar in size to 202 w/o the battery pack. Kantronics KPC-3 is a little larger, as is AEA PK-12. You will not need the optional Y-cable, unless you intend to run mobile w/laptop. In that case, you must also validate APRS and GPS with Bob. Good luck.

Dayglo, eh?

I have several CDs and many many megabytes of DEM data for my Vistapro landscape visulazation program. ER-Mapper can also use DEM data I believe. DLG data is also avaiable on CD and via Internet. I have some street level maps made from DLG data and a program with which to view/plot GPS posit's on them.
 The problem I've found with 3D maps is the inability of most programs to provide a "calibrated" output.

At 12:39 AM 11/11/96 -0600, you wrote:

222. DLG Based Packet Location System

From: Jim Olsen <JIM_OLSEN@novell.com>
Date: Mon, 11 Nov 1996 09:29:39 -0700
To: aprssig@tapr.org
Message-ID: <s286f22c.005@novell.com>
Rendered body type: text/plain

Hi everyone,

        I wanted to gather some opinions on required features for a generic packet location system that I am working on. Let me preface this with the intent of what I am doing for some context setting.
        First, I do not want to support all of the features of the APRS

style software. I am going for a VERY detailed map package, with
support for packet location. In this way I can have a tracking system
that is useable in the wilderness terrain of my area (Utah). I need topo
line support to tell where anyone actually is, and the APRS system does
not support this adequately in the map format/drawing methodology. I
am not as interested in supporting all of the different 'base station' kind
of operations that APRS does. I recognize these are useful in a larger
case, but again, not for my applications (mobile search and rescue,
hiker tracking, etc.), which often preclude the use of more than one
mobile computer, due to weight/realistic constraints.
        What I have so far is a package which is Windows 95 based,
and has several capabilities which are listed here:

        Reads and displays USGS 1:100,000 standard format DLG
                maps.
        Displays ALL layers (hydrography, topo lines, roads, etc.)
        Allows filtering of any layer (display / don't display)
        Full zoom (through vectors, so no degradation of data)
        Real time scrolling of map
        Multiple map windows allowed on screen simultaneously
        One or more packet receive windows for multi TNC support
                (packet receive is for positional info only)
        GPS Receive window (one or more)
        Station list displaying call, lat/long, course and speed
        Station list editing of Icon plus all of above
        Add station through point and click on map
        Lat/Long tracking on cursor movement over window
        History file record/playback

What I ended up with is something which provides me the basic
functionality of tracking multiple stations, on USGS quad level quality
maps. I am in the process of doing some basic testing at this point, and
it seems to work pretty well. Eventually, I would like to release it in an
alpha form to interested parties, but before I do this, I would like to get
people's opinions on what other functionality is a MUST HAVE for the
kinds of applications I am concerned with. Note that I am not looking to
replicate APRS. They have done an excellent job on this stuff for a
broader range of applications. I want to focus around the kinds of
things I need it for. I originally had developed this for myself, but a
bunch of people have expressed interest in it after seeing it, so I would
like it to be able to hit a broader audience.

Thanks for the thoughts in advance,

Jim Olsen

Hi All

We here in Albany NY are in the planning and discussion stage of
improving our packet capabilities as they relate to the National Weather
Service .

We are currently using a "traditional" packet network and are discussing
the differences between it and APRS. I would be interested in ANY input
from those of you who have had "traditional" packet and switched to or
added APRS as a means of digital communications with NWS. I'm very
interested in what are the benifits of one system vs. the other to the
NWS.

I'm looking to be sold on both systems so as to help us make an informed
decision as to which we should choose. We are of course open to using
both systems if that suits the NWS best.

Thank you in advance and here's hoping to start a CONSTRUCTIVE
conversation.

John M Domblewski N2OJY

Great idea Jim, but to only have a Windows 95 platform makes it rather
limited i think, how many avarage people have a laptop of that sort. Also I
think the map display if the number one priority (Scanned maps maybe). The
USGS maps available or old and outdated.

Just a tought 73.

I agree about the win95 only stratagy. Doing straight Windows 3.1
(no win32s!) will allow it to run on the maximum number of platforms
including WIN-OS/2, Win95, WinNT?, Win3.1, Mac windows emulators, etc...

I am not committing nor un-committing to any specific platforms at this time. My initial development environment is Win95 (since that is what I am running), so that is my alpha environment too. I am actually writing in Borland C++ 5.0, utilizing OWL, so it should move pretty painlessly to Win 3.1, with a little modification in how the serial communications are being done (which I fairly well isolated since I knew this would be coming eventually).

On the USGS thing, I agree many of the maps are out of date, but many counties keep up to the minute versions in their GIS programs, which will all output standard format DLG. I know our county does. If nothing else, the rivers/topo/major roads don't change too much, so it is a great starting place for covering most of the country right out of the chute.

Thanks for the many comments, they are helping me to gel my coding directions!

Mark- please don't miss the point.

The request was a "vacation" message sort of like an email "rule". The message is processed, but a return message says something LIKE "I'm away from the terminal" OR "I am eating- get back to you later". No one in their right mind would say "Just call me stupid... I'm away for 6 months. Come rob me".

One of the reasons I suggested it is that I was away for a few days, leaving the system on for the WX data it sends and several persons messaged me, filling up my screen and getting no response. They then thought I was ignoring them and contiued asking "are you there... are you ignoring me?" until they filled the line buffer DosAPRS provides.

It is fine to archive the messages (I wish DosAPRS held more), but I think an "away" message is useful. It is up to us to decide what to say in it.

At 07:45 AM 11/11/96 -0600, Mark said:

>Mac/WinAPRS never rejects messages, they always are entered into the

Hi everyone,

Thank you very much for all the info that everyone provided. It was quite helpful. I will probbably be in contact with Patcomm just as soon as I raise some $$$ from all the stuff that I am selling on the net. Hopefully before the end of the year you will be seeing me on the air doing APRS. I just have one further question: Would you recommend purchacing the GPS 20 from TAPR? I figure that this may be the one most ppl are using and there will be a lot of projects built around it. It just seems such a waste to tuck my GPS 40 away in my car especially when it has such a nice display.

BTW since several ppl asked:

Rendered body type: text/plain

>Great idea Jim, but to only have a Windows 95 platform makes it rather
>limited i think, how many avarage people have a laptop of that sort.

There have been several comments about Win95 and Win3.1, people that are not developers dont realize the significant difference between the model for 3.1 and for 95.

On 3.1, the memory model is segmented and has limitations, there are libraries that implement this for you and and make it a lot easier, but...

dealing with LARGE amounts of data under 3.1 is not NEAR as easy as on 95.
Windows 95 and Windows NT has a flat memory model, this means memory starts
at 0 and keeps going until you run out. it is NOT segmented (paged) like
on Win3.1.

The Win32S DLL set allows programs written for Windows 95 /NT to run under
Windows 3.1. There are a few things, specifically serial I/O, that cannot
be done in the Win95 maner while running under Win32S. If a programer pays
attention to these few minor things that cant be done, then ONE program
works seamlessly for both platforms.

Mark

Hello.
I really like the APRS software!
The other day I got about 15 hits -- even one from Puerto Rico!

I registered the software with you folk awhile back but I lost the
registration number you sent me along with the sheet about how to
enter the number in the program.

Could you please send it again?

Sorry.

I keep seeing this problem appearing.  Why not make a backup disk of the
APRS software and write the registration numbers on the diskettes.  I do
this for my commercial software, just incase the documentation gets
sepparated from the disks. For CD-ROMs, use a magic marker to write the
number on the disk.

APRSdos REPLY/COMMENT: Nope, APRSdos will just stop accepting messages
after 23.  From then on it will send out REJects instead of ACKS.  This
is to alert the sender that that stations apparently has no human operator
and it is useless to keep sending him messages until he begins reading
some of them.  Remember, APRS is for real-time tactical communications not
necessarily the long term 24 hour a day we are using it for practice....

I am getting BUSY from the site now (with O C T).  Is BUSY what connect
requests that are NAKed look like at my end? It doesn't answer a O Q
callsign or a ping from APRS either. I can connect to the NODE callsign ok.

Guess I have to do the 100 mile round trip to un busy it.  Let me think...
I would have to (at the KPC-9612 TNC) do [is it?] CONOK = OFF to prevent
connects from locking it up?

Too much remote diagnosing... Too many possibilities... I will have to see
what I find and report back.  Unless, someone has additional suggestions on
what to try from "here".

Send suggestions to: k9orp@amsat.org

HAY YOU GUYS WHO ARE USING APRS WITH THE NWS PLEASE TELL THE REST OF US
HOW AND WHY!!!!!!!!!!!!!!!

I hope I didn't hurt anyones ears but there seems to be a CROWD of
people with inquireing minds.:-)
We need the specifics.
Please get us moving as we are begging for some ELMERS!!!

John

Hi Steve

Thanks for the reply!

I'm not sure of the capabilities. I think perhaps you are making the
assumption that I know more than I do. If you could go one level lower
you'd probably be on my level.

APRSdos REPLY/COMMENT: APRS has nothing to do with CONNECTS. BUSY means
the TNC is connected to someone. APRS will autmoatically force the TNC to
disconnect every time it sends its STATUS BEACON. (at least once every 20
minutes, so just wait.)   If someone connects to an APRS station it will
go to blue screen (OCT) for 3 minutes, then it will also try to
disconnect.

APRS should not affect how the PBBS works however.

>HAY YOU GUYS WHO ARE USING APRS WITH THE NWS PLEASE TELL THE REST OF US
>HOW AND WHY!!!!!!!!!!!!!!!

Can't speak for everyone because each area is unique and our operation is
less than one year old. Our NWS office has a responsibility area of 37
counties. They are severely undermanned and any electronic assistance that
doesn't interfere with their normal operation is welcome. The non-verbal
visual assistance of Amateur Radio reports coming in on a map that they can
compare to the reports they send out is welcome. Our NWS office does have
a 2 meter FM net control position that is manned during watches.

The local, county-wide in our ARES case, emergency communication is supplemented by an APRS operator, on 145.79, (one per voice net) entering reports that come in. Those are sent on a 445 MHz APRS 9600 baud backbone to the NWS office. In non-weather cases, the reports go to the ESDA office for dispersion to the affected agency. They would pass reports to Red Cross in the case of disaster surveys or Police in case of accidents or position of response vehicles. We have an elaborate SOP that is too lengthy to describe in the answer to this question. You are welcome to e-mail me directly (k9orp@amsat.org) for further discussions.

The value of APRS is the non-verbal aspect as well as time stamping and logging of reports. Non-verbal is important because an emergency is doing many things at once and most of the time two or more audio reports come in inadvertantly and are reported. The APRS acts like a situation board for all to see.

The comparison between packet APRS position reports and packet BBS reports are best described as brief versus lengthy. If you need the brevity, use APRS on APRS frequencies. If the traffic is a command, NTS or welfare related, use BBS type messages on regular packet channels. DO NOT USE THE SAME FREQUENCY!!!

If everyone (that wants to answer the APRS NWS question) briefly told what their area does, ONCE, then the rest of the WX and APRS chat can take place by direct E-Mail. I think it would make the rest of the APRSSIG happy.

Rendered body type: text/plain

A few weeks ago someone wrote up how they put two digi's on the air using an existing antenna. At that time some of us here in the Boston area were planning how we could add an APRS digi to a site where we already had a packet digi on 145.030. We decided to take a different approach and now that we have it up and working I figured I would tell everyone what we did.

The group that was working on this were all members of the Minute Man Repeater Association and most of them are on the technical committee that sets up and supports the clubs 11 repeates (i'm the one that is not on the technical committee). A couple of the 2 meter repeaters had been replaced in the last few years and we found that we had 12 cans (filters) sitting around not being used. The normal 2 meter repeater split is 600khz and the split between the two digi was more (760Khz) than that so we figured we would use these filters thathad worked well with repeaters to isloate the two digi systems.

We took 6 band pass filters and tuned 3 of them to pass 145.030 and tuned the other 3 for for 145.79. With this we found that we had more than 100db of isolation between the two systems. We hooked up the transmitters and they are both working well. On the APRS side it is working better than it was was prior to this (on a lower antenna) just because the pass filter was filtering out lots of noise that had been getting to the receivers front end. The results is a digi in Marlboro Ma. that can now hear stations in Rhode Island, Northern Ct, mid NH, and into central Ma.

I would also like feedback from those in New England to get a feel for how wide the coverage really is. So if you see N1QPR-2 let me know. Tomorrow (Wed Nov 13) we will make this the WIDE for the Boston area and change another local digi, N1CPE-2 to RELAY.

just another idea

Bill

I have been thinking of getting the JPL Amateur Radio Club to do
something similar to what Tom Clark W3IWI is doing, providing DGPS
signals in th Los Angeles area. Our club trustee thinks it is a great
idea; however, he has expressed concerns over how this fits in under the
Part 97 rules.  He feels that it should go somewhere in the beacon band
as it is an automatically generated signal, has no control operator and
expects no connections. I said that it was a packet signal and could go
anywhere packet is allowed.

Any comments?

Also, using the UHF/VHF diplexor/splitter ($60 dollar things) at the
transmitter end of a feedline to a non-grounded 2 meter vertical, we use
445.925 APRS and 145.79 APRS on the same 2 meter antenna.   I might add...
at the second site we tried this, we had a DB products folded dipole 2
meter antenna on the tower.  IT DID NOT WORK.  Antenna must be the coax
vertical, gain type, non-grounded (probably non-gamma matched).

Now, if you get picky and want range comparisons, I can't help you because
this is the only Amateur antenna on the tower.  I can tell you that with
same power on each band.  The signal fades out at the same point on a dual
band mobile.

Bottom line is "It is better than nothing."

Ok, let me try again. What exactly do you want to accomplish with the installation. Something like this should start with a set of goals.

Do you want to support a network of automated weather stations, maybe mobile Skywarn spotters or tornado chasers? This is an application where APRS shines.

Do you want to diseminate forecasts and other weather products to a number of widely dispersed, pre-arranged sites such as emergency op centers or emergency shelters? Then regular packet is better.

Do you want to collect damage reports, casulty lists etc and forward them to an EOC? Regular packet.

Get the idea? Tell me what you want to do and I can help you pick. If you just pick a system, throw it up, and then see if you can put it to use you will be disappointed!

To The Authors'

Can you guys tell me about the file transfer capabilities of the various versions of APRS. Not only do we have a relationship with NWS but we have, after many years of trying, finally developed a relationship with our new county emergency manager and the local hospitals. They all express an interest in our digital capabilities but their interest seems to be in the transfer of things like lists of thinks.

TNX

It's important for APRS that the dgps be broadcast on the
same freq as APRS - 145.79 here in the DC area. That way you can
do regular APRS tracking and have differential at the same time:
one radio, one tnc, one computer. The chief disadvantage of the
USCG dgps broadcasts, besides the antique LF band, is that it
requires a separate radio.

Results here show that a 20 second dgps packet is sufficient to

keep your GPS locked on differential, and still doesn't clobber
the APRS traffic.

I believe the same logic that lets you bcst APRS beacons holds
for a dgps packet, too, so there's no administrative difficulty.

Cheers,
Bob Kirk
N3OZB

APRSdos REPLY/COMMENT: Many people would probably agree that permanent
such installations would raise some eyebrows. Certainly in the long run
if this were perceived as a "service".

But what Tom is doing is certainly experimental and we are lucky to have
Tom here testing DGPS on Amateur radio in our area.

But APRS does not need the DGPS accurracy for its intended purpose, which
is tactical-real time communications and tracking moving vehicles. Even
if you are WALKING at just 3 MPH and your reporting rate is once a minute
(high by APRS standards) then you have moved almost 300 feet or more than
the average error of SA anyway. Why bother.

If you want a good fixed location, then DGPS helps, but leaving your GPS
in one spot and averaging positions over a length of time will also give
you excellent accurracy. We get consistent results to less than a foot
this way over a few days of averaging...

So why cut your APRS channel throughput in half by adding a DGPS if you
dont really need it. Again, Tom's DGPS here is not causing us any
problems, the net can handle it. But you might think about what you are
really trying to do before going to all the effort. If you have
mountains, then you might consider placing it on a big one, and on a
different FREQ so that it is available for others, but does not clog the
APRS channel.

THis is not to say that there aren't valid AMATEUR applications for
DGPS and better GPS accuracy, but from my perspective, APRS is not one of
them. hi hi

It seems as though I want it all and perhaps the lights will come on
soon for me!:-)

when we do certain aspects of public service we would want to transfer a
list of names or something like that. Other times we would want to make
announcements. My problem is that I'm not sure what we want exactlly. I
think thats why I'm interested in the experiences of some of the members
of the group as to what works and what doesn't. I think that info will
help me to decide what we NEED to do. I'm not trying to be difficult.
We of course what to provide a means for the various emergency
organizations to gather and distribute information via amateur radio
digital modes.

John

I need to see if the perms are set correctly on my Mobile unit.
I have the GPS and KPC3 running in the auto but I see the data being
sent out but the $GPGGA always shows the same data and is not updating.

I have a KPC-3.  The CMSG is set to PBBS.  With CT telling anybody
trying to connect they will be automatically forwarded to mt -1
mailbox.  They cannot connect to mycall this way so as not to interfere
with APRS.  You have to set USERS to 2 also.

If your $GPGGA string always shows the same data, then the most likely culprit is the GPS! If you are using a Garmin unit the most likely cause is not having a TRUE negative ELECTRICAL ground on the black wire. If you connect the black wire from the GPS to the -12 VDC (NEGATIVE) line then data will flow, otherwise nada....

I cannot get my Garmin-45 to send course and speed information to my KPC-3. $gprmc works fine except no course and speed and $gpvtg does not send course and speed. I'm using WinAPRS and have seen other stations with the red line for cse and speed so I dont't think it's the program. Does the Garmin-45 not send this data or is mine broke?

Do you have the black wire from the I/O port connected to ELECTRICAL ground? Do you have the I/O Setup set to NMEA/NMEA? Do you have NMEA-0183 v2.0 selected?

Those are the most likely problems...

Good luck!

I send RMC and GGA data as
that gives Course , speed and alt.
Check that you are using NMEA 0183 2.0 in the Garmin-45 I/O setup.

The latest version of MACAPRS has a bug that causes course and speed
vectors not to be displayed. I just use an older version. SO WinAPRS
may have the same problem but Mark fixes things fast so check the
latest version.

Here is what is in RMC and GGA

```
####################################################################

$GPRMC,123519,A,4807.038,N,01131.324,E,000.0,276.9,150895,000.5,E*73
       HHMMSS,V,DDMM.MMM,N,DDDMM.MMM,E,SPEED,TRACK,DATE  ,DEVIA,E*CS

HHM..:time UTC
V:      validity flag (V=invalid, A=valid)
DDM..:degree value of latitude
N:      north/south (N/S)
DDD..:degree value of longitude
E:      east/west (E/W)
SPEED:speed over ground, measured in knots
TRACK:course over ground or track
DATE:   current date
DEVIA:magnetic deviation
E:      east/west (E/W)

####################################################################
$GPGGA,123519,4807.038,N,01131.324,E,1,08,0.9,545.4,M,46.9,M, , *42
       HHMMSS,DDMM.MMM,N,DDDMM.MMM,E,Q,NS,DOP,ALTI ,U,FF.F,U,?,?*CS

HHM..:time UTC
DDM..:degree value of latitude
N:      north/south (N/S)
DDD..:degree value of longitude
E:      east/west (E/W)
Q:      quality of fix(?)
ALTI:   integer value of height above sealevel
U:      units (M=meter)
?:      unknown
CS:     checksum

####################################################################
```

The latest version of MACAPRS has a bug that causes course and speed
not to be displayed. I just use an older version. SO WinAPRS may
have the same problem but Mark fixes things fast so check the latest
version.

Hello Roy,
  I have the I/O setup on mine reading:
NMEA/NMEA
NMEA 0183  1.5
4800 BAUD

  And it works fine. Check these settings out.

1. What is NMEA?

The National Marine Electronics Association is dedicated to the education and advancement of the marine electronics industry and the market which it serves.

It is a non-profit association composed of manufacturers, distributors, dealers, educational institutions, and others interested in peripheral marine electronics occupations
(quoted from a promo in "NMEA News")

1.1 What is an NMEA standard?

For the purposes of this article, an NMEA standard defines an electrical interface and data protocol for communications between marine instrumentation. (They may also have standards for other things.)

1.2 NMEA Address

P.O. Box 3435
New Bern NC, 28564-3435
U.S.A.
Phone: 919-638-2626
Fax: 919-638-4885
http://www.coastalnet.com/business/electronics/nmea/nmeawww.html

2. Electrical Interface

These standards allow a single "talker", and several "listeners" on one circuit. The recommended interconnect wiring is a shielded twisted pair, with the shield grounded only at the talker. The standards do not specify the use of any particular connector.

The NMEA-0180 and 0182 standards say that the talker output may be RS-232, or from a TTL buffer, capable of delivering 10 mA at 4 V. A sample circuit shows an open collector TTL buffer with a 680 ohm resistor to +12 V, and a diode to prevent the output voltage from rising above +5.7 V.

NMEA-0183 accepts this, but recommends that the talker output comply with EIA-422. This is a differential system, having two signal lines, A and B. The voltages on the "A" line correspond to those on the older TTL single wire, while the "B" voltages are reversed (while "A" is at +5, "B" is at ground, and vice versa)

In either case, the recommended receive circuit uses an opto-isolator with suitable protection circuitry. The input should be isolated from the receiver's ground.

In practice, the single wire, or the EIA-422 "A" wire may be directly connected to a computer's RS-232 input.

3. NMEA-0180 and NMEA 0182

NMEA-0180 and 0182 are very limited, and just deal with communcations from a Loran-C (or other navigation receiver, although the standards specifically mention Loran), and an autopilot.

From the information I have, it appears that 0180 and 0182 are identical. I suspect that equipment claiming to use NMEA-0180 will use the "simple" format described below, while those using NMEA-0182 will use the "complex" format. (but this is really just a guess... corrections??)

3.1 "Simple" data format

The simple format consists of a single data byte transmitted at intervals of 0.8 to 5 seconds, at 1200 baud with odd parity. Bits 5 - 0 give the cross-track error in units of 0.1 uS or 0.01

nautical mile. The error is given in offset binary, with a count of 1 representing full scale right error, 32 (hex 20) for on course, and 63 (hex 3f) full scale left error. Bit 6 is a 1 if the data is valid, and bit 7 is 0 to indicate the simple data format.

3.2 "Complex" data format

The complex format consists of a data block of 37 bytes of (mostly) readable ASCII text giving cross-track error, bearing to waypoint, present Lat/Long, and a binary status byte. The data block shall be sent at intervals of 2 to 8 sec. All bytes in the complex format have bit 7 = 1 to distinguish them from the simple format. It is permissible for a sending device to send both simple and complex data, and even to send a "simple" data byte in the middle of a "complex" data block.

Byte	Data	
1	$	
2	M	device
3	P	address
4	K = kilometres N = nautical miles U = microseconds	cross track error units
5 - 8	0 - 9 or .	cross track error value
9	L or R	cross track error position
10	T or M	True or Magnetic bearing
11 - 13	0 - 9	bearing to next waypoint
14 - 23	12D34'56"N or 12D34.56'N	present latitude
24 - 34	123D45'56"W or 123D45.67"W	present longitude
35	non-ASCII status byte bit 0 = 1 for manual cycle lock 1 = 1 low SNR 2 = 1 cycle jump 3 = 1 blink 4 = 1 arrival alarm 5 = 1 discontinuity of TDs 6 = 1 always	
36	"NUL" character (hex 80)(reserved status byte)	
37	"ETX" character (hex 83)	

Any unavailable data is filled with "NUL" bytes.

4. NMEA-0183

4.1 General Sentence Format

Under the NMEA-0183 standard, all characters used are printable ASCII text (plus carriage return and line feed).

The data is transmitted in the form of "sentences". Each sentence starts with a "$", a two letter "talker ID", a three letter "sentence ID", followed by a number of data fields separated by commas, and terminated by an optional checksum, and a carriage return/line feed. A sentence may contain up to 82 characters including the "$" and CR/LF.

If data for a field is not available, the field is simply omitted, but the commas that would delimit it are still sent, with no space between them.

Since some fields are variable width, or may be omitted as above, the receiver should locate desired data fields by counting commas, rather than by character position within the sentence.

The optional checksum field consists of a "*" and two hex digits representing the exclusive OR of all characters between, but not including, the "$" and "*". A checksum is required on some sentences.

The standard allows individual manufacturers to define proprietary sentence formats. These sentences start with "$P", then a 3 letter manufacturer ID, followed by whatever data the manufacturer wishes, following the general format of the standard sentences.

Some common talker IDs are:

GP	Global Positioning System receiver
LC	Loran-C receiver
OM	Omega Navigation receiver
II	Integrated Instrumentation (eg. AutoHelm Seatalk system)

4.2 Sentences sent by specific equipment

This section lists the sentence types used by various equipment. The format and data included in each sentence type is given in section 4.3.

Eagle AccuNav
    Standard: RMB, RMC, GLL, APB
    Proprietary: PSLIB
    It also pretends it's a Loran, sending LCGLL, as well as GPGLL

Garmin GPS-45 (and probably GPS-40 and GPS-90)
    Standard: BOD, GLL, RTE, RMB, RMC, GGA, GSA, GSV
    Proprietary: PGRME, PGRMM, PGRMZ

Garmin GPS-65 (and probably GPS-75)
    Standard: BWC, GLL, RMB, RMC, R00, WPL, XTE, VTG
    Proprietary: PGRMM, PGRMZ, PSLIB

Magellan Trailblazer
    Standard: APB, BWC, GGA, GLL, RMB, RMC, VTG
Trimble Ensign XL
    Standard: APA, BWC, BWR, GGA, GLL, RMB

Trimble Flightmate Pro and Scoutmaster
    Standard: APA, APB, BWC, GGA, GLL, GSA, GSV, RMB, RMC, VTG, WCV, XTE, ZTG

Autohelm Seatalk

Autohelm Seatalk is a proprietary bus for communications between various intruments. Some of the instruments can act as NMEA-0183 talkers or listeners. Data received from an external NMEA-0183 device will, if Seatalk understands the sentence, be re-transmitted, but not necessarily in the same sentence type.

The specific sentences sent will depend on the data available on the Seatalk bus (i.e. sentences containing wind speed and direction will only be sent if the system includes a wind instrument)

Seatalk output:
Standard: APB, BPI, BWC, VWR, VHW, DBT, GLL, HDM, HDT, HCS, MTW, VTG

Seatalk input:
Standard: APA, APB, RMB, XTE, XTR, BPI, BWR, BWC, BER, BEC,WDR, WDC, BOD, WCV, VHW, VWR, DBT

4.3 Sample Sentences Dissected

4.3.1 Standard Sentences

A talker typically sends a group of sentences at intervals determined by the unit's update rate, but generally not more often than once per second.

Characters following the "*" are a checksum. Checksums are optional for most sentences, according to the standard.

APB - Autopilot format B
APB,A,A,0.10,R,N,V,V,011,M,DEST,011,M,011,M

A	Loran-C blink/SNR warning
A	Loran-C cycle warning
0.10	cross-track error distance
R	steer Right to correct (or L for Left)

```
           N            cross-track error units - nautical miles
           V            arrival alarm - circle
           V            arrival alarm - perpendicular
           011,M        magnetic bearing, origin to destination
           DEST         destination waypoint ID
           011,M        magnetic bearing, present position to
destination
           011,M        magnetic heading to steer
                        (bearings could be given in True as 033,T)
           (note: some pilots, Roberston in particular, misinterpret
"bearing
           from origin to destination" as "bearing from present position
to
           destination".  This apparently results in poor performance if
the
           boat is sufficiently off-course that the two bearings are
           different.)

        BOD - Bearing - origin to destination waypoint
        BOD,045.,T,023.,M,DEST,START
           045.,T       bearing 045 True from "START" to "DEST"
           023.,M       breaing 023 Magnetic from "START" to "DEST"
           DEST         destination waypoint ID
           START        origin waypoint ID

        BWC - Bearing and distance to waypoint - great circle
        BWC,225444,4917.24,N,12309.57,W,051.9,T,031.6,M,001.3,N,004*29
           225444       UTC time of fix 22:54:44
           4917.24,N    Latitude of waypoint
           12309.57,W   Longitude of waypoint
           051.9,T      Bearing to waypoint, degrees true
           031.6,M      Bearing to waypoint, degrees magnetic
           001.3,N      Distance to waypoint, Nautical miles
           004          Waypoint ID

        BWR - Bearing and distance to waypoint - rhumb line
                (format same as BWC)

           46.9,M       Height of means sea level above WGS84 geoid
           (empty field) time in seconds since last DGPS update
           (empty field) DGPS station ID number

        GLL - Geographic position, Latitude and Longitude
        GLL,4916.45,N,12311.12,W,225444,A
           4916.46,N    Latitude 49 deg. 16.45 min. North
           12311.12,W   Longitude 123 deg. 11.12 min. West
           225444       Fix taken at 22:54:44 UTC
           A            Data valid
             (Garmin 65 does not include time and status)

        GSV - Satellites in view

GSV,2,1,08,01,40,083,46,02,17,308,41,12,07,344,39,14,22,228,45*75
           2            Number of sentences for full data
           1            sentence 1 of 2
           08           Number of satellites in view
           01           Satellite PRN number
           40           Elevation, degrees
           083          Azimuth, degrees
           46           Signal strength - higher is better
           <repeat for up to 4 satellites per sentence>
                There my be up to three GSV sentences in a data packet
        HDM - Heading, Magnetic
        HDM,235.,M
           HDM          Heading, Magnetic
           235.,M       Heading 235 deg. Magnetic
            (HDG, which includes deviation and variation, is recommended
            instead)

        HSC - Command heading to steer
        HSC,258.,T,236.,M
           258.,T       258 deg. True
           236.,M       136 deg. Magnetic

        MTW - Water temperature, Celcius
        MTW,11.,C
           11.,C        11 deg. C

        R00 - List of waypoint IDs in currently active route

R00,MINST,CHATN,CHAT1,CHATW,CHATM,CHATE,003,004,005,006,007,,,*05
           (This sentence is produced by a Garmin 65, but is not listed
           in Version 2.0 of the standard.  The standard lists RTE for
           this purpose.)

        RMB - Recommended minimum navigation information (sent by nav.
                receiver when a destination waypoint is active)
        RMB,A,0.66,L,003,004,4917.24,N,12309.57,W,001.3,052.5,000.5,V*0B
           A            Data status A = OK, V = warning
           0.66,L       Cross-track error (miles), steer Left to correct
           003          Origin waypoint ID
           004          Destination waypoint ID
           4917.24,N    Destination waypoint latitude 49 deg. 17.24 min.
N
           12309.57,W   Destination waypoint longitude 123 deg. 09.57
min. W
           001.3        Range to destination, nautical miles
           052.5        True bearing to destination
           000.5        Velocity towards destination, knots
           V            Arrival alarm  A = arrived, V = not arrived
           *0B          mamdatory checksum

        RMC - Recommended minimum specific GPS/Transit data
        RMC,225446,A,4916.45,N,12311.12,W,000.5,054.7,191194,020.3,E*68
           225446       Time of fix 22:54:46 UTC
           A            Navigation receiver warning A = OK, V = warning
           4916.45,N    Latitude 49 deg. 16.45 min North
           12311.12,W   Longitude 123 deg. 11.12 min West
           000.5        Speed over ground, Knots
           054.7        Course Made Good, True
           191194       Date of fix  19 November 1994
           020.3,E      Magnetic variation 20.3 deg East
           *68          mandatory checksum

        RTE - Waypoints in active route

RTE,2,1,c,0,W3IWI,DRIVWY,32CEDR,32-29,32BKLD,32-I95,32-US1,BW-32,BW-198*69
           2            two sentences for full data
           1            this is sentence 1 of 2
           c            c = complete list of waypoints in this route
                        w = first listed waypoint is start of current
leg
           0            Route identifier
           W3IWI...     Waypoint identifiers

        VHW - Water speed and heading
        VHW,259.,T,237.,M,05.00,N,09.26,K
           259.,T       Heading 259 deg. True
           237.,M       Heading 237 deg. Magnetic
           05.00,N      Speed 5 knots through the water
           09.26,K      Speed 9.26 KPH

        VWR - Relative wind direction and speed
        VWR,148.,L,02.4,N,01.2,M,04.4,K
           148.,L       Wind from 148 deg Left of bow
           02.4,N       Speed 2.4 Knots
           01.2,M       1.2 Metres/Sec
           04.4,K       Speed 4.4 Kilometers/Hr

        VTG - Track made good and ground speed
        VTG,054.7,T,034.4,M,005.5,N,010.2,K
```

```
   054.7,T      True track made good
   034.4,M      Magnetic track made good
   005.5,N      Ground speed, knots
   010.2,K      Ground speed, Kilometers per hour
```

WCV - Waypoint Closure Velocity
WDC - Distance to Waypoint
WDR - Waypoint Distance, Rhumb Line

WPL - waypoint location

```
WPL,4917.16,N,12310.64,W,003*65
   4917.16,N    Latitude of waypoint
   12310.64,W   Longitude of waypoint
   003          Waypoint ID
```

When a route is active, this sentence is sent once for each waypoint in the route, in sequence. When all waypoints have been reported, GPR00 is sent in the next data set. In any group of sentences, only one WPL sentence, or an R00 sentence, will be sent.

XTE - Cross track error, measured

```
XTE,A,A,0.67,L,N
   A            General warning flag V = warning
                        (Loran-C Blink or SNR warning)
   A            Not used for GPS (Loran-C cycle lock flag)
   0.67         cross track error distance
   L            Steer left to correct error (or R for right)
   N            Distance units - Nautical miles
```

XTR - Cross-Track Error - Dead Reckoning

```
XTR,0.67,L,N
   0.67         cross track error distance
   L            Steer left to correct error (or R for right)
   N            Distance units - Nautical miles
```

4.3.2 Proprietary Sentences

The following are Garmin proprietary sentences. "P" denotes proprietary, "GRM" is Garmin's manufacturer code, and "M" or "Z" indicates the specific sentence type.

```
$PGRMZ,93,f,3*21
   93,f         Altitude in feet
   3            Position fix dimensions 2 = user altitude
                                        3 = GPS altitude
```

This sentence shows in feet, regardless of units shown on the display.

```
$PGRMM,NAD27 Canada*2F
   Currently active horizontal datum
```

Proprietary sentences to control a Starlink differential beacon receiver. (I assume Garmin's DBR is made by Starlink)

```
$PSLIB,,,J*22
$PSLIB,,,K*23
```

These two sentences are normally sent together in each group of sentences from the GPS.

The three fields are: Frequency, bit Rate, Request Type. The value in the third field may be:

J = status request
K = configuration request
blank = tuning message

When the GPS receiver is set to change the DBR frequency or baud rate, the "J" sentence is replaced (just once) by (for example): $PSLIB,320.0,200*59 to set the DBR to 320 KHz, 200 baud.

5. RS-232 connections

Although this is not really related to NMEA, many people want to connect a GPS to a computer, so need to know about the RS-232 serial ports on a computer.

The RS-232 standard defines two classes of devices that may communicate using RS-232 serial data - Data Terminal Equipment (DTE), and Data Communication Equipment (DCE). Computers and terminals are considered DTE, while modems are DCE. The standard defines pinouts for DTE and DCE such that a "straight through" cable (pin 2 to pin 2, 3 to 3, etc) can be used between a DTE and DCE. To connect two DTEs together, you need a "null modem" cable, that swaps pins between the two ends (eg. pin 2 to 3, 3 to 2). Unfortunately, there is sometimes disagreement whether a certain device is DTE or DCE, hence my standard RS-232 disclaimer:

if it doesn't work, swap pins 2 and 3!

The standard RS-232 connector is a 25 conductor DB-25, although many PCs (and some other equipment) now use a 9 pin DE-9 (often incorrectly called DB-9)

Serial Port Connections

Computer (DTE)				Modem
DB-25	DE-9	Signal	Direction	DB-25
2	3	Tx Data	->	2
3	2	Rx Data	<-	3
4	7	Request to send	->	4
5	8	Clear to send	<-	5
6	6	Data Set Ready	<-	6
7	5	signal ground		7
8	1	Data CarrierDetect	<-	8
20	4	Data Terminal Ready	->	20
22	9	Ring Indicator	<-	22

For NMEA-0183 interfacing, we are only concerned with Rx Data, signal ground (and possibly Tx Data, if we want the computer to talk to the GPS)

6. About the author

This FAQ was written by:
Peter Bennett
bennett@triumf.ca

I have an FTP site containing this file, a GPS FAQ, and other NMEA information files and PC programs for capturing and displaying NMEA data, and related things:

ftp://sundae.triumf.ca/pub/peter/index.html

6.1 Acknowlegments

APRSdos REPLY/COMMENT: I hope you have loooked, and replayed DIGI-SE.bk.
When you get your data, plese send it to me so I can update DIGI-SE.bk for
everyone else...  These files DIGI-E, SE and W should be the single and
best source of such info, but getting people to send me the info is like
pulling teeth, hi hi..

SEND ME ONLY CHANGES, however, I dont have time to search and compare
lists...

Arc and Intergraph will (fairly) painlessly export to OPTIONAL format DLG, but
at lease ARC 7.0 won't give us STANDARD format DLG.  I've not looked to export
much from Intergraph MGE but I'll look today, since I've gotta finish a GIS
for the meeting in Denver (where I'll be talking about APRS to the GIS
community...)

Jim,  I'll be re-visiting your original post and developing e-mail comments
after the meeting.

Randy,

My take on it is, it's packet, it's a service to local amateurs (eg., QST).
Therefore, with appropriate ID'ing it could go whereever the APRS activity is.

I'll be putting up a DPGS beacon here in College Station, Texas, but it'll be
on commercial freq's... because that's where the folks paying for it are doing
AVL work. Still and all, I'll be publishing the frequency and possibly
splitting off the feed to a 145.79 transmitter sometime in the future.

73, gerry

Dear Ron:

I am using a DSP 2232 on gateway and it works fine.  Just follow the
instructions on setting the gate way under unproto.  Use the "U" command and
set to Bob's instructions.  Set the MYGATE to GATE and it will gateway HF to
VHF.  Works well and if you have any more questions let me know.

Thanks

296. Re: [APRSSIG:6324] file transfer question

From: dougwe@ccintnet.wrq.com
Date: Wed, 13 Nov 96 08:22:44 PST
To: aprssig@tapr.org
Message-ID: <9610138479.AA847902291@ccintnet.wrq.com>
Rendered body type: text/plain

John, you probably want to set up tcp/ip on a separate frequency for that. IP is an outstanding choice for file transfers - you can request multiple files at once with the mget command, and the link will auto recover without a whole lot of operator intervention.

I strongly suggest you do it at 9600 or above, though. 1200 does work, but it's painfully slow.

73,
Doug
K7IP

To The Authors'

Can you guys tell me about the file transfer capabilities of the various versions of APRS. Not only do we have a relationship with NWS but we have, after many years of trying, finally developed a relationship with our new county emergency manager and the local hospitals. They all express an interest in our digital capabilities but their interest seems to be in the transfer of things like lists of thinks.

TNX

Am I missing the point of APRS,  position reporting of mobiles, bases
and wx reports and one line emegency traffic.

Will not File transfers kill the aprs frequency altogeather, I think
that this type of transfers should be left to regular packet
frequencies using regular bbs's etc not on APRS, its starting to get
more than 100% in this area all the time now.

I guess I better put my flame suit on...
Just my opinion

I think we can assume the eyebrows will stay pretty flat. No one
has objected to such permanent installations as, say, weather stations
cranking out over APRS, and that's a pretty nice service.  I think
we're ok. Hate to be told to turn off those Ultimeters & Davis'.
Beacons on APRS are pretty well accepted, and after all, dgps
is closer to AP(osition)RS than AW(eather)RS.

Hi All

Thanks to all for your input...

Ok lets pretend I'm NWS and I don't have a clue about this APRS stuff.
Give me the "pitch" as to why I should have this system. You know
"features and benifits".

I very much appreciate the input so far but I think everyone is
assumming I know more that I do. This is one of those "Keep It Simple
Stupid" kind of situations. No one has articulated the reason that APRS
is so well suited to the emergency communications arena.

John

Subject changes from 'APRS and the NWS" to KPC3+GPS for mobile

If the DOSaprs doc file KPC3.txt needs more setting information
to understand how to use the GPS mode let me or BOB know and
it can be updated.

If you are only going to output one NMEA value try $GPRMC.
Good news it that the KPC-3 can output four different NMEA
types.

Rendered body type: text/plain

I have been using the Garmin Data Cable to connect my GPS45XL to my KPC-3. The only problem with that is the power pin is not connected and you must use the units batteries. I just received a Power/Data cable from GARMIN and I now have external power going to the GPS45XL. I was wondering if the red wire for power might be in the Data cable but just not connected to the 9 pin plug. I tried finding it by sticking a needle in the cable and using a multi-meter, no luck. I then cut the plug off and had a good look see. Its not there. I installed a new plug and it is as good as new. Just a tip, don't cut the plug off the Data cable looking for the power wire. 73, Jud

Ben,

What you're probably referring to is "built-in GPS capability". That code is in the version 6.0 ROM, which I believe is the current revision. You don't *need* the current ROM to run APRS with a PC, only if you plan to build a "stand-alone tracker" that will interface the TNC and the GPS directly. Version 5.1 works fine for a QTH or even a mobile that interfaces the TNC and GPS through a computer. That said, you can obtain the upgrade ROM from Kantronics for a reasonable fee (around $29-$39 if I remember correctly...). Check out Kantronics WWW site for additional info (http://www.kantronics.com).

310. help needed for CalComp 2500 Digitizer

From: Bob Derderian <n2iph@cyberenet.net>
Date: Wed, 13 Nov 1996 17:46:52 -0500
To: APRS dicussion group <aprssig@tapr.org>
Message-ID: <328A4FDC.7A61@cyberenet.net>
Rendered body type: text/plain

```
Hello All,

I have a CalComp 2500 digitizer that I would like to use for making
local maps, but am not able to get the tablet communicating with the
computer 'cause I do not have the manual for it and do not know how to
use the built-in menu system of the tablet to configure it.

I went to the CalComp website and have the latest drivers and have them
installed per instruction, except for the section that says the tablet
needs to be set to a particular mode and refers one to "see the manual".

Anyone have a manual for the 2500, my model is a 25183, built in
Aug, 1988. Is there an overlay that has the menu commands on it? When I
go into Setup from the menu bar at the top of the tablet, and then click
on the tablet active area below each of the menu headings, things change
in the configuration of the tablet but without the overlay I have no
idea of what I am changing.

I tried opening a dumb terminal window to monitor the comm port and see
if anything was fed out on the port when making configuration changes
but see nothing.

Any help or path to a known source for manual and/or overlay would be
appreciated.

TNX, Bob

This can't, of course, be just any old TNC.  It must be a 1200 bps
VHF/UHF type that 'recognizes' the NMEA string sent out the serial line
of the TNC.  There are many on the market, such as the Kantronics KPC3,
the Picopacket by PacComm, and even the AEA PK96 and many others.  Just
any old TNC may not do the job.

The TNC must be set up ahead of time with a terminal or computer to
operate with the GPS.  Once all this is done you can bundle it together
with your GPS and your radio.

I use a KAM and the APRS program doesn't always transmit as it thinks it
is. I made sure that the streamsw is set to ~A (Tilde A) for HF and |A
for VHF. I then sometimes have to do a C B V, C B H sequence, or vice
versa, to get the alternate band to transmit. That combination always
works, assuming your cabling is correct. Good luck.

Tom

You have "laptop scrunch syndrome".
I think it is because your screen can display more than the standard EGA
(or is it VGA- never can remember). The computer wants to keep the same
"Aspect ratio", so it shrinks the display.

My IBM Thinkpad has it, but the setup program has a feature called
"vertical expansion" that stretches everything just enough to fill the
screen back up.

Unless Toshiba has a utility, Ii think u r out of luck.  I know of none
(other than the Thinkpad) that do.

This was discussed here a year ago pretty extensively.

On Fri, 25 Oct 1996 14:14:54 -0400 (EDT) lourigan@STC.Net writes:
On the Toshiba the APRS display does not

I have nothing at all to do with the NWS, I just thought I would jump in on
this thread for a brief comment.

Are you aware that the digital cellular phone community is working on a
system by which your digital cellular phone will be used to send WX info
directly to users in certain areas. In other words, since the digital
cellular network will know where your are at within +/- 125 meters, and has
one way messaging capability, it WILL be sending weather watches and
warnings for display on the phone.

Perhaps it is important to set up APRS as a WX uplink path, and let the NWS
take care of downlink to the public.
```

321. DOS APRS in WIN95 in Background!

From: Rick Tilton <Nationwide@InfoAve.Net>
Date: Wed, 13 Nov 1996 22:50:38 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <01IBTBD23UZY8YB90P@InfoAve.Net>
Rendered body type: text/plain

Hello all and tnx for reading! Have been following the SIG for months now. LOT to read but have found useful stuff. This is my first msg to the SIG and hope it is useful. Now for the information I have. MAYBE I am the *LAST* to know but a friend of mine (WA4SSP) discovered this and I am passing it along to you just in case you did not know. As you know you can obviously run DOS version of APRS in WIN95. BUT did you know that you can also run it in the BACKGROUND! Start DOS APRS from the run or create your own shortcut. AFTER it starts running (and gets settled) hit "F10" key and it will put DOS APRS in a DOZE mode. This creates a black box so to speak. Then you can minimize the box to the taskbar and do whatever you want to do in WIN95. THEN you can click on the taskbar and bring back up the little black box. THEN hit F10 again and you are back in DOS APRS. You will have to hit the space bar about twice to get it back to life again. Don't ask me what the doze mode does. I FORGOT!? But it stops some kind of output to the I/O or something. BUT we have tested and have actually received msg's while it is in doze mode. It seems to run in some way (that I don't know all of yet) and yet it keeps the graphics part from overloading everything so that it don't blow up as things did in 3.1 when you had heavy graphics. Go figure! It's great! Installed BUS MOUSE in my 486/80 and now run APRS and Internet at same time back and forth. Don't mean to bore you but thought this might help those that still want to run the DOS version of APRS instead of the WAPRS version (Sorry Sproul's!) CUL & 73.... de Rick.. N4WYK.

323. KPC-3 on a boatride

From: Steve Gemeny <sgemeny@access.digex.net>
Date: Wed, 13 Nov 1996 23:09:23 -0500 (EST)

To: aprssig@tapr.org

Rendered body type: text/plain

OK, lets see if the NEWBIE can be helpful and avoid flamage
(sorry if the bandwidth is excessive).

Background
Ham since 1989 extra since February
Mostly active on 2 M fm and, lately, HF
Knew about APRS... but `what do I need it for?'

The Enlightenment
Dad asked me to crew on his 44 foot cabin cruser to Florida... nice trip but I was going to have trouble leaving the harmonics for a week (The oldest, 11 year old Sara, is N3XYG.) Maybe I can find a way to involve them in the trip and learn something at the same time. And then WB4APR shows up on 147.00 with a chirp in his squelch tail.

The project
I had a KPC-3 and an Kenwood TH-75 that could be pressed into service for the home station. I found APRS on the web... download successful... installation successful. Connection from the KPC-3 to the computer completed (except for the send data... don't want to transmit before I figure out what I'm doing!), now to pickup some of these putouts. Getting plenty of data but its not showing up on the map. Butt my head into the wall for a few days, swallow my pride (I am, after all an intelligent technical HAM) and call the brothers Sproul. `No problemo gotta configure the KPC-3 to output the format APRS is looking for'.
    send the following:

```
Interface terminal
reset (moves the KPC-3 out of new user mode and into full command set)

mcom off
mresp off
headerlin off ( in short, don't send all the <> stuff and don't
                parse the header)
```

`YO lookatthat' putouts all the way from NC to VT. This stuff really works. Thanks guys, you made my day.

Now for a package that can ride the boat. Got an old ICOM business VHF rig from a friend, reprogrammed it for 145.790, modified it to accept remote audio from the TNC. Picked up another KPC-3 (no time to jump horses now) and a Magellan GPS, now I'm ready to `rock-n-role'... well almost.

Setup the Magellan to startup at 9600, then, using the com program in an HP palmtop (my mobile DTE), get the GPS to spit out the GPGGA string by sending `$PMGLI,00,B00,2,A,00'. Got the GPGGA sentence on the Palmtop display, now for the TNC.

But what do I do about all that WIDE, GATE, RELAY stuff... go to the oracle.
A quick call to Bob and all is well.
KPC-3 setup as follows:

```
        light the GPS on power up
GPSINIT $PMGLI,00,B00,7,A,00^N (you need the ctrl N to make a CR)

        in general, me
BTEXT Yacht CAMELOT ENR Florida
UNPROTO APRS via RELAY,WIDE,WIDE

        specifically, my position
GPSHEAD 1 $GPGGA
GPSHEAD 2 $GPGGA
GPSHEAD 3 $GPGGA

        sent trice by different routes
LTP1 APRS via RELAY,WIDE,WIDE
LTP2 APRS via WIDE,GATE,GATE,WIDE
LTP3 APRS via WIDE,GATE,KF0ZH,GATE,WIDE

        at 10 min intervals
BLT 1 EVERY 00:10:00
BLT 2 EVERY 00:10:00
BLT 3 EVERY 00:10:00
```

ditto for me
BEACON EVERY 10

Final test
It all finally came together around Noon on October 16,1996 for a scheduled departure form Solomons Island MD at 0600 on the 17th. (close only counts in horseshoes and handgranades).

Magellen GPS, KPC-3, VHF radio, HP Palmtop 12 Volt 6AH battery in a plastic Briefcase with externl GPS antenna and 12 VDC ship/car power input (and a partridge in a pare tree).

First putouts from AA3NM-8 were from Gaithersburg, MD and enroute to Solomons 'till 0200 on the 17th. Camelot departed at 0615 on the 17th with full APRS operational at 35 Watts into a J-pole topping 22 ft. above the water. Putouts continued down the intercoastal waterway until separating from Camelot at 0815 October 20 to drive home (yes... `Pinging' all the way).

Crew:
Capt. W3OKB
1st Mate N3WUJ
Sysop/Nav AA3NM
Galley W3OKB/XYL

I hope some of my setups are helpful. Yes I coulda mighta shoulda done some things differently, but hey it worked. I hope some of you saw a boat driving around Gaithersburg then heading south. Look for us again between 12/25 and 1/5, then again in the spring heading North.

And thanks guys for all the help
73 DE AA3NM

In other words, since the digital cellular network will know where your are at within +/- 125 meters, and has one way messaging capability, it WILL be sending weather watches and warnings for display on the phone.
>
> Perhaps it is important to set up APRS as a WX uplink path, and let the NWS take care of downlink to the public.

Hi Paul

This is the way it's done now we provide the spots and they(NWS) provide the forcast. This cellular thing will just be one more way to provide info to the public.

John

Gentlemen (and ladies)....

Please remember that it is totally inappropriate to completely quote someone
else's posting except in the circumstance that a quotation is proper to make
a point.

ALSO.....

It is completely inappropriate to waste the bandwidth and the on-line time
of the rest of the members of the SIG to attach "cute little GIF files"
which get stored on everybody's hard drive without at least making the
availability known and asking if anyone REALLY would like to have them first!

(I have received three messages like this this evening alone!  I'm SO glad
that I spend $140.00 per month for ISDN telephone service plus an additional
$29.95 for ISDN Internet access through my ISP just so I can watch have my
very own copy of a "cute little puppy" playfully hopping back and forth
across my monitor.)

IN A NUTSHELL:   STOP IT!  (or at LEAST have the courtesy to ask before you
send...)  Hey....For all I know that cute, little puppy could be a virus in
disguise.

This is NOT cool.  This is ALSO not the way to introduce yourself to the
APRS SIG.....

Alex,

There is a wonderful program called MacDLG by Mike Musick,N0QBF.
Can't recall where I downloaded it, but fairly sure Mike mentioned it on the SIG here. MacDLG is a Mac program that makes APRS maps from 1:100,000 DLG data. Very slick application! (Tnx Mike)Alessandro Donati wrote:

APRSdos REPLY/COMMENT: Isnt that like mine? Use MAPFIX and when you use FILES-OPEN to open the comm port to the DIGITIZER, then there should be a full screen of instructions on the CALCOMP (at leat mine so I could see it each time). YOurs may be slightly different, but maybe that will help...

> back in DOS APRS. I dont remember what DOZE does...

APRSdos REPLY/COMMENT: It Tells aprs to go to text mode and to not write
ANYTHING to the screen. THat way it doesnt have to try to be compatible
with all the bazillions of settings for graphics. Since WinAPRS came out,
I have not paid close attention to my DOZE function, so if it crashes on
you because I have added something new that does accidentally write to
the screen, plesae let me know. A good test is to put APRS in doze mode
in forground and let it run for a LONG time. If anything goes to the
screen, let me know what...

APRSdos REPLY/COMMENT: Sorry, but since I changed to supporting the BUS
Mouse, MAPFIX no longer will do the poor-mands digitizer. I just havent
had time to go play with it. If anyone wants to take that on, have fun...
MAPFIX is available in source code as MAPFIX27.bas But you must run it
undre QB.exe not Qbasic.exe and you must use the /L option so the mouse
library will be loaded...

338. WinAPRS 1.1.7

From: Mark Sproul <sproul@ap.org>
Date: Thu, 14 Nov 1996 12:47:42 -0500
To: aprssig@tapr.org
Message-ID: <v03007805aeb108872880@[165.1.27.20]>
Rendered body type: text/plain

As promised, the next release of WinAPRS is up on both Rutgers and TAPR as
of today. The improvements and bug fixes are listed below.

As normal, there are 2 files, WAPRS117.ZIP and W117UPDT.ZIP, the second
being just the update file.

There is also a new release of MacAPRS, version 2.6.7, this will be put up
on the servers later today.

Mark

Version 1.1.7 - November 14, 1996

*** Major weather additions. Added configurable display for any station

```
that has weather data.

*** Added Unproto path list, this is a list of the paths that each station
is using

*** You can now double click on an airport in the airport list and it will
take you to the best map that displays that airport and show you were it
is.

*** Incoming messages to the user now brings up the message window
automatically.

*** Fixed message window bug that replied to the wrong station unless ALL
MESSAGES was selected.

*** Fixed date bug that only occured on the last day of the month.

*** Fixed one or two minor memory leaks, this might help with some of the
crashs that a few users were having.

*** Fixed bug that did not reliably start the Davis weather input all of
the time.

*** When running dual port TNCs, message acks now go out the right port.

*** When running dual port, the station list now shows properly red/blue
for HF/VHF stations.

> Will not File transfers kill the aprs frequency...?

I have to concur with Ron. Unless there is a programmed limit on the size of
the file and it is *NOT* user modifiable, and it is VERY small (>1K) and it is
limited to text only, I see channel capacity going down in flames. The intended
use is laudable (list transfer in a public service setting), but the potential
for abuse and impact to the user community is beyond significant - more like
"Ohmygawd!".

Frankly, experience says if the feature is there, the impact to others will be
"overlooked" and the channel will get trashed.

When 9600 bps or better is the standard we can begin to think about this, but -
really - not before.

Roy,

I am going to assume that your problem is with a standalone tracker,
because WINAPRS is what sends the info to the KPC-3.

SO if it is a standalone. . .
```

The problem may be that you have nor told the KPC-3 to look for the vgt
sentence
set the gpshead parameter in your KPC-3 to $GPVGT and it must be in CAPS!

You have 4 gpshead slots so if you use any additional spaces, be sure to
set up the corresponding blt and ltp parameters.

Good Luck

Hi All,

On Wed, 13 Nov 1996 Rick Tilton wrote:

>... hit "F10" key and it will put DOS APRS in a DOZE mode ...
>minimize the box ... and do whatever you want ... in WIN95 ...
>click on the taskbar and bring back up the little black box.
>THEN hit F10 again and you are back in DOS APRS ...

I find it easier to simply press Alt-Esc, which will also
minimize APRS to the taskbar, but doing it this way APRS re-
mains ACTIVE in the background. Using the "DOZE" mode allows
you to keep APRS in memory but, unless your TNC has a humongous
buffer (or you get back to it fairly soon,) you'll be missing
information and won't be uplinking your info.

I HAVE, however, found that I can't use my landline modem
on COM3 (TNC is on COM1) when using this method, but I think my
screwy Packard Bell may be the culprit here. I haven't tried
Rick's method yet, so I don't know whether that would be a work
around for this situation. 73

NEW IDEA!  Ever been frustrated by not knowing what maps you have loaded
on what PC?  I am modifying my next version of APRSdos, so that the MAPS-
WHICH command will give you a list of all XXMAPS.ZIP distribution files
that you have loaded.  Neat idea, huh?

BUT I need the help of all mapmakers!.  Please put in the MAPS directory
of every distribution package a file named XXmapsXX.TXT  You can put
anything you want in the .TXT file, because all I am going to do with my
MAPS-WHICH command is to do a DIR MAPS\*.txt to list all of these .TXT
files.  In mine, Im going to put upgrade notes showing what is new in each
new release of my XXmapsXX.ZIP distros.

Remember that for MAP.ZIP distribution packages to work right, you have to
zip them up with the PKZIP -RP option as discribed in MAPS.txt.  This way
users can use the standard PKUNZIP -D and get everything in the right
place...

APRSdos REPLY/COMMENT:  WRONG.  I named the mode DOZE because it helps in
a winDOZE environment.  APRS is still running fully.  It just doesnt write
anything to the video card while "DOZEing"  This makes it work in all
windows bnackgrounds (hopefully) without having to worry about video and
screen compatibility problems.  Hope this helps.

```
>The problem may be that you have nor told the KPC-3 to look for the
>vgt sentence set the gpshead parameter in your KPC-3 to $GPVGT
>and it must be in CAPS!
```

For the Garmin-45, note the difference between
having an I/O setting of Version 1.5 or version 2.0
I think most people use version 2.0 .

NMEA INTERFACE INFORMATION:
Garmin-45

0183 version 1.5 (Approved sentences BWC, GLL, RMB, RMC,
XTE, VTG, WPL; Proprietary sentences PGRMM (map datum),
PGRMZ (altitude), PSLIB (DGPS beacon remote control)).

0183 version 2.0 (Approved sentences GCA, GLL, GSA, GSV,
RMB, RMC, RTE, WPL; Proprietary sentences PGRME (estimated
error), PGRMM (map datum), PGRMZ (altitude), PSLIB (DGPS
beacon remote control).

The GPShead parameter is looking for an exact match so what ever
you are trying to read must match, be it upper or lower case. The
NMEA approved GPS sentences are uppercase.

The line string match can be a GPS, a Davis/Peet WX system, or
a DFrj Doppler DF unit, or some other fun device. What ever you
want to trigger a line capture for later transmission.

If you have a Garmin-20 set one of the GPShead to $PGRMT
and the world can tell if your GPS board is too hot !!
Output is in Degrees C.

You might want to output a $GPRMC that sends a POSIT and a GPS
course and speed.

The Alt (height above sealevel) that is part of $GPGGA doesn't change
much except in the LOCKS. :-)

From: Gerald J Creager[SMTP:gerry@cs.tamu.edu]
Sent: Wednesday, November 13, 1996 1:26 AM
To: aprssig@tapr.org
Subject: [APRSSIG:6350] Re: APRS, DPGS, etc.

Randy,

My take on it is, it's packet, it's a service to local amateurs (eg., QST).
Therefore, with appropriate ID'ing it could go whereever the APRS activity is.

I'll be putting up a DPGS beacon here in College Station, Texas, but it'll be
on commercial freq's... because that's where the folks paying for it are doing

```
AVL work. Still and all, I'll be publishing the frequency and possibly
splitting off the feed to a 145.79 transmitter sometime in the future.

Don't know about the Peet...but 1.1.6 and 1.1.7 have been working well
with the Davis...at least temp, wind dir/speed, and barometer. No rain
measurements yet on the air, but it registers on the screen.

Mr. Duncan:
Thank you for your comment. I would inform you that the day's have long
since passed in which I could have been reffered to as someone without a
proper knowledge of "Netiquette". May I refer you to your "ALSO" above,
you don't have to shout.

The "cute little gif file" again was intended for and to Mr. Don Cole
who collects and sends them via e-mail to his 70+ year old mother in
Florida.  She enjoys them so.

I use them as a "signature" in my "private posts'", unlike some "10 line
asterik
boxed autobiography", or "super sized ascii "call sign" type signature
files I have seen on this SIG.

I will make the availability known... This is a standard animated gif
format file.
Since for whatever reason it is now on the SIG, if you are using
Netscape, place the mouse cursor on the center of the line containing
the "puppy" and press the right mouse button. Select save file  and
place in the directory of your choice.
Now Mr. Duncan you can have your very own "cute little puppy".

> (I have received three messages like this this evening alone!  I'm SO glad
> that I spend $140.00 per month for ISDN telephone service plus an additional
> $29.95 for ISDN Internet access through my ISP just so I can watch have my
> very own copy of a "cute little puppy" playfully hopping back and forth
> across my monitor.)

Mr. Duncan:
As you can probably see, I didn't send the other two.

Where did you obtain your ISDN service at such a low rate. I wasn't that
lucky, It costs me more than that here in Texas.

If I had something on my screen I didn't want I'd use my "delete"
function.
You can find your's by reading the Help File that came with your
browser.

If you can't find it.. unsubscribe or get a larger capacity hard drive..
They're so inexpensive nowadays.

> IN A NUTSHELL:   STOP IT!  (or at LEAST have the courtesy to ask before you
> send...)  Hey....For all I know that cute, little puppy could be a virus in
> disguise.

Mr. Duncan:
I understand.
Now, If you did, you'd know that, number one, your'e "shouting" again,
and number two,
unlike a .bat, .exe, .com, or .zip file, that you would not or could not
pick up a "virus" from an uncompressed and uncontaminated graphics
format file.
```

> This is NOT cool. This is ALSO not the way to introduce yourself to the
> APRS SIG.....

Mr. Duncan:
Excuse me?? I don't believe That I am introducing myself to the SIG, or
for that matter, trying to be cool. I check the SIG every day, but I
never reply to anyone's post unless I have the proper information to
pass on regarding their inquiry.
Check your archives...

Stevech (Hey guys -- add your call to either your From: or signature!) asked Gerry (N5JXS) about the DGPS beacons. Since (as far as I know) I'm the only amateur DGPS generator, let me answer. Here in the Baltimore/ Washington area, the W3IWI-13 DGPS sends out differential corrections once per 20 seconds.

The DGPS signals are generated by a professional (Trimble 4000SSE) dual-frequency GPS receiver operating on one of the many antenna ports associated with the GODE IGS GPS facility. The DGPS bits come out of the professional "toys" and poke into a strictly amateur setup on the local 145.79 APRS net. The signals are relayed thry WIDE,WIDE and cover the entire Chesapeake Bay area, plus parts of SNJ, EPA, NoVA and WVA. Your TNC provides the DGPS data in a format similar to that coming out of a Coast Guard (~300 kHz) or commercial FM broadcast subcarrier (like DCI or ACQUPOINT) source. The local users report it provides corrections at the few meter level and that velocities reported by their GPS receivers are MUCH more accurate.

I presume Gerry's idea is to tap the "sponsored" DGPS signals at the RS232 level and do the same thing at Cow College!

Regarding the questions on legality: All of our packet radio "beacons" are subject to the same question! The FCC has been mute on the topic for several years. If they were to be asked formally, they would either say "you amateurs are supposed to be self enforcing. We have no opinion", or they would say "Now that you bring it up, a lot of your activities are not covered by the rules and hence are not legal". The moral of the story is "DON'T ASK!!!"

357. HELP-UTM Grid to LAT/LON Conversion

From: "Theodore A. Antanaitis" <tedant@pipeline.com>
Date: Fri, 15 Nov 1996 03:22:34 -0500
To: aprssig@tapr.org
Message-ID: <1.5.4.16.19961115082234.31970da2@pop.pipeline.com>
Rendered body type: text/plain

HELP!

I am trying to improve the precision of a program which converts UTM Grid X-Y coordinates to latitude/longitude values.

The mapping program I have put together does a good job on the conversions to latitude but not on the conversions to longitude. I am getting conversion errors of up to 4 seconds of longitude.

Is there a formula, algorithm, or look-up table available for this conversion that I can incorporate into my program? Are any reference texts available? I am currently using a routine based on straightforward trigonometry with a linear error correction derived from reference points.

The source UTM data that I am using is from the 1:2,000,000 Scale USGS DLG
CDROM Mastered 7/95. (This CD does not contain any LAT/LON based DLG files)

Any help would be appreciated.

Ted Antanaitis WA7ZZB

---------- Forwarded message ----------
From: "Eric A. Cottrell" <eac@shore.net>
To: amsat-bb@amsat.org, bitbucket@lists.primenet.com
Subject: Approximately 100.00 US dollar GPS receiver

It was bound to happen sooner or later. Today I got an ad from
DeLorme for Street Atlas 4.0 and in the flyer they had a page on
their Tripmate package.

Tripmate is the Street Atlas 4.0 CDRom with a GPS receiver!

The shock was that as an upgrade special SA 4.0 was
25 dollars and Tripmate (SA 4.0 plus GPS receiver) was 125 dollars!

The documentation says that it can only be used with SA 4.0.
The SA 4.0 CD also has MapnGo 2.0 drivers for the unit.
It takes 4 AA batteries. Specs say it is a 12 channel L1 C/A-code
receiver (most likely muliplexing two real channels) using
NMEA-0183 protocol. There is just a serial cable coming out
of the box and there are no controls on unit.

It is a small yellow oddly shaped plastic box. The bottom comes
off to reveal a battery holder on one half and a metal plate
covering the electronics with glyptol covered screws on the
other half. The manual mentions a power adapter kit for
powering the GPS receiver through the cigarette lighter
or laptop. It uses a patch antenna on the top of the
unit. No external antenna connector.

I have not gotten a chance to power it up and it is too
soon to break the seals on the screws. But I am going
to hook this puppy up to a comm analyzer because I
got a feeling that this unit may be useful for stuff like
that dreaded ARPS (Amateur Radio Position Service).

I would think that it would have a "power" switch either
through software or by using a handsake line on the
serial port. Otherwise the batteries would go flat after
a few hours. The manual also mentions that the
SA 4.0 program can send a inital position to the
tripmate.

I will let you know when I got further infomation.

This may be overkill, but there is a program by the US Corps of Engineers
named CORPSCON (surprise!) which does multiple geodetic conversions using
the National Geodetic Survey geodetic modelling conversions, plus others.
It will convert UTM to Lat/Long, and I think will do batch processing.

The program is available by ftp at
/survey1.tec.army.mil/pub/software/corpscon.410/v41xzip.exe (for everything,
all 3.3Meg)

If you don't need vertical conversions, and want a much smaller download, get
everything in the directory EXCEPT v41xzip.exe, and vertcon*.*.

This covers CONUS, Puerto Rico/Virgin Islands, and Hawaii. If the
CONUS.*,PRVI.*,
and HAWAII.* files are not in v41xzip.exe, get the *.LAS and *.LOS files
separately. Alaska is one directory up and under corpscon.alask/. The UTM may
not need the *.LOS and *.LAS files.

You may also be able to get the source code from the COE, I'm not sure.

Good Luck!

367. Re: Digitizing with a MAC

From: Mike Musick <71301.3106@CompuServe.COM>
Date: 15 Nov 96 13:06:52 EST
To: <aprssig@tapr.org>
Message-ID: <961115180651_71301.3106_FHJ52-1@CompuServe.COM>
Rendered body type: text/plain

To Dennis and Dan -

<blush!> Appreciate the kudos, guys! Makes the effort worth it, you know.

I completely missed that Alex's query was for a Mac. (Like... uh... duh, it was in the header!) I s'pose that I was thrown off by the DL-land call. We have to bear in mind that MacDLG will only work for US locations, because it relies entirely on public-domain map data supplied by our government.

I was contemplating going world-wide with DOD's "Digital Chart of the World" data, but found it way too coarse and the data format arcane and overly complex given the result. My objective, anyway, was to fill a need for local, detailed maps, since my particular APRS niche is public service (local events) and foxhunting/RDF.

There was a "micro" release (v1.05) at the ARRL Convention which I keep forgetting to package for upload to the TAPR server. It fixed a couple of minor bugs and allowed the wide lines feature to be selectable.

A serious effort is under way to completely redo the optimization routines, although it has been waylayed over the past two months due to a big project push at work. With Keith Sproul's help, I was able to determine that MacDLG was actually not optimizing vectors as well as it should, and that the process could be much, much, MUCH more efficient. Preliminary tests say that we should see a 10X improvement in optimization time and maybe another 5-10% reduction in map file size.

I'm also looking at the possibility of user redesignation of road typing through a selection list which is reviewed after optimization. In other words, a US40 or a State Route 79 may actually be a freeway, but they get "mis-typed" because there's no "limited access" subcoding in the DLG data (only in TIGER). Another related feature, though low on the list, is the ability for the user to select the Mac/WinAPRS color for each line category. The palettes have been built, but I've got to get my head clear first about using resource-based pop-up menus.

Something else on the "hot" list is the ability to take a raw GPS data stream from data captured during a route drive and allow it to be added to an existing map. The only qualm I have about this is editability - even my best-intended driving efforts to trace a particular route end-up with a wrong turn somewhere!

<g!>

Political boundaries (borders) are on the long list, but line subtyping has proved vexing. I'm not happy with the tests so far, so until there is an epiphany about determining the line categories, I'm not inclined to draw boundary lines. There's a lot of specious data (for example, a city park here is somehow defined as a political area) so they really clutter maps with meaningless vectors if you let everything fly.

Due to work and "life" commitments I can't begin to project availability of v2.0, but cross your fingers and there might be something new out during the winter.

Again, thanks, guys.

  ...mike/N0QBF

Last night I had a situation that may explain the concept:
- A new packeteer
- A new TNC
- A new PC
- A presently installed TNC software package.

He installed APRS and said "it" was too complicated. He said "APRS was..."

We have to judge each condition separately and compare the level of
expertise, not that it takes experts for APRS, in order to see if the
complaint is the whole computer thing or the software package.

Similar to what I waht to do... 'Cept I doubt I'll cover the Chesapeake Bay
very well...;-)

> I presume Gerry's idea is to tap the "sponsored" DGPS signals at the RS232
> level and do the same thing at Cow College!

since I'm the "sponsoring authority" (it's OK to cringe, Tom) that will be
pretty easy. We're using it for AVL applications on commercial UHF, in a
17-county scenario, and the local Municipal Planning Org. will now use the
RTCM outputs for their mapping and geocoding, too. I intend to do a
WIDE,RELAY scema here, since we don't have WIDE,WIDE coverage around here
reliably. I'll be checking on that and WIDE by itself for best performance.

Here, hear.

I have also done this extensively for Cows In Space albeit without
digipeaters, and have had exemplary success. It isn't too hard to do
mechanically/electrically. I just had to pry all the pieces from the hands of
folks who thought THEY needed 'em.

An aside: I know it's unlikely, but is anyone else going to GIS-LIS 96 in
Denver next week? I've a Wednesday morning "performance" where I'll be doing
the Cows In Space song and dance.

Tom, thanks for the leads. We're on our way to UNAVCO membership, I think,
and starting to do long baseline work with 1-2 cm closures.

Go check on the USGS site for utilities. If memory serves, they have the
algorithm for UTM to NAD27 and NAD83. Mind your projections.

>-----------------------------------
>Version 1.1.7 - November 14, 1996

>*** Major weather additions. Added configurable display for any station
>that has weather data.

There are some VERY nice features in this:

1. If you select Display Wx Stations Only you get a nice table on the
map next to the callsign of the station showing current conditions
and the age of the report. (Zoom down some to unclutter the screen)
This is a GREAT feature.

>*** Added Unproto path list, this is a list of the paths that each
>station is using

1. I haven't seen an entry appear in this window yet, and don't have
a clue as to what this window is doing. (Program has been running
for a couple hours). Any ideas?

>*** Incoming messages to the user now brings up the message window
>automatically.

1. This is a very nice idea as well, but I haven't gotten a message yet,
   so can't say how it works. Like the idea.

>*** Fixed message window bug that replied to the wrong station unless ALL
>MESSAGES was selected.

1. Thanks. Not tested yet, but a very welcome fix.

>*** Fixed one or two minor memory leaks, this might help with some of the
>crashs that a few users were having.

1. I am up to 32 mb ram now, so not sure what I will see in terms of
   memory problems. I may not be fit for testing any longer with this
   much ram on board.

>*** When running dual port TNCs, message acks now go out the right port.

1. A good fix, not tested here yet. (No messages received yet)

>*** When running dual port, the station list now shows properly red/blue
>for HF/VHF stations.

1. Works perfectly and very much enhances the station display in the
lists.

Nice bunch of fixes, Mark and the wx enhancements really add a lot. I now have a series of very small windows open to selected parts of the country, just large enough to show the enhanced wx data for a given station. Really adds functionality to the wx stuff, and the AGE report is a GREAT feature. (AGE is the number in RED...how long since the last wx update from that station.

Speaking of weather: Last night, based on the assurances of the NWS, I left Ames for Des Moines to do some training. NWS said, "Don't over-react, not to worry, no precip until after Midnight". HA!

At 5 p.m. the freezing rain started. I left for Ames (normally a 30 minute drive), at 6 p.m. I sat on I-35 just south of Ankeny for an hour and 14 minutes. Drove the rest of the way at 8 mph, and got home 3 hours later after one of the scariest trips I have ever taken. Thankyou NWS, TV-Weather, et al....you all had it VERY WRONG....and by SIX HOURS. Sheesh!

> >  SPECI KIOW 140626Z AUTO 00000KT 1SM BR CLR 12/11 A3007 RMK AO
>
```

The data is being transmitted by W0BXR-2, which is a TNC located at the NWS Davenport office. The data is from the NWS Weather Wire, has been reformatted for packet retransmission, and apparently the radio is set to APRS instead of the packet frequency that it should be on. I have sent the NWS e-mail regarding this problem, recieved no response, and the data still flows. I only see it if the band opens at night, but it must be driving Larry nuts since he is closer than me. I askad Hasan if he knew anybody out there, but he didn't. If there is someone lurking on the sig from Davenport please contact the NWS or someone @ Davenport

Radio Amateur Club (the call holder) and have them fix it.

377. New Callsigns on N2CHV digis

From: Mark Humphrey <mark@y100.com>
Date: Fri, 15 Nov 1996 19:10:52 -0500
To: aprssig@tapr.org
Message-ID: <328D068C.4698@y100.com>
Rendered body type: text/plain

This weekend, I plan to change the callsigns on the N2CHV-2 and N2CHV-3
WIDE-RELAY digipeaters in eastern PA to reflect my new callsign, KE3XY,
which was issued several days ago. The SSIDs at each site will remain
the same.

I'm aware that several of you are using these specific callsigns in your
UNPROTO paths. After you see the new calls appear on the screen, please
change your paths accordingly.

For your convenience, I will retain the old calls as aliases for a few
weeks (in addition to WIDE and RELAY), so your packets will still be
repeated until you make the changes... However, the MYCALL setting
(which functions as legal ID) will be updated, so this won't be very
apparent....

I wonder if anyone has had any experience with the case of the missing
mouse?

I just brought an old 486 sx 25 home from the office. It had some kind of
unknown terrible video card in it that I have just replaced with a new
Diamond SpeedStar 64 2000, 2 Meg Dram, ISA. The mouse cursor has
dissapeared from APRS but it is fine with other applications. I have
reloaded two other mouse drivers with the same results. When I move the
mouse the Lat and Lon display moves accordingly and the Left button shows
the "zoom" bar. But there is no mouse cursor on the screen. Is there a
new stealth mouse that I don't know about?

Before you say it there is no cat on this machine!

Help Appreciated........73 Mark (WB0NOO)

Hello and thanks for reading this..

I am in need of help with setting up my U2000 to operate remotely
(without computer terminal) Aprs with my KPC-3 TNC.

I need the list of TNC commands that I need to send and also need to
know how others have the U2000 connected to the back of the KPC-3
(cabling and such). Do I need to simply go purchase a DB9 to DB25
converter??? It can't be that simple..grin

Thanks for any and all help

Hello,

The unit seems to lock on the satellites reasonably fast.   I downloaded
the New England area onto my laptop and the moving map display is
neat.

I should also mention that this unit does not have any controls on it
so it cannot be used for hiking, etc unless you tote another computer
along.

I hooked it up to a comm analyzer and played alittle. Communications
are 4800 baud using ASCII characters so far. The serial port does not
assert handshaking signals so hardware handshaking should not be
used.

Power control appears to be the DTR line. Asserting DTR powers up the
unit and it sends three NMEA messages (PRWIRID, GPRMC, and
PRWIZCH) then keeps sending a non-NMEA formatted character string until
it receives a $IIGPQ message with the character string. I was able
to program a function key on the windows terminal to send the string
and NMEA sentences poured out of the receiver.

NMEA messages begining with P are reserved for manufactuer's
messages. RWI, I believe, is Rockwell International

The II prefix on the computer response message is the NMEA code for
Intergrated Instrumentation. I cannot get a listing for what a GPQ
message is. The "non-NMEA formatted message" may be a valid way for
a device to hand off talking to another unit under NMEA. NMEA only
allows one talker at a time.

Some of the NMEA sentences:

PRWIRID seems to contain number of channels, version number and software
build date RID could be a nmemonic for Receiver ID

PRWIZCH twelve sets of what seems to be satellite PRN and a
single digit code. Could be a channel status.

GPRMC, GPGSA, GPGGA, GPGSV   Standard NMEA fare.

I need to log the output as no doubt almanac and other messages
are sent. I also have a Garmin 45 and may set it up so I can
log the output of both units and do some comparisons.

Wayne, WA2N/5 mentioned to me:
>Here's a good place for GPS info, NMEA specs and shareware:

```
>  ftp://sundae.triumf.ca/pub/peter/index.html
> Also, check out the newsgroup sci.geo.satellite-nav
```

The newsgroup currently has discussions on SA 4.0 and Tripmate.

I have used several Delorme products for years. Street Atlas 1.0
was the reason I bought a CDROM Drive. I had a few problems with
the software, but it is a great product that keeps getting better.

Rendered body type: text/plain

```
I'm having a serious problem with the SIG!  When attemp[ting to down load
my e-mail form my ISP, I'm getting a FATAL ERROR on the message after
message #6395 (should be 6396?).  This message is preventing me from
downdoading my e-mail and thus has effectively stopped me from receiving
any e-mail!  This has happened before and the only resolution was to have
my ISP to remove my e-mail account and create a new one (which we will
probably have to do again today).  Would someone on the sig look at the
message that followed #6395 and see if there was anything unusual about it?
 Untill my ISP can get my e-mail cleaned out . I will not be able to
receive any e-mail. Thanks

>:-)

I can well appreciate the sentiment of not letting one rather narrow topic
take over the sig, but OTOH, we've spent a lot of time here talking and
learning about the technology, with precious little energy being spent on
practical application.  Of course, in order to properly apply technology to
provide solutions to problems, one must first understand it, but then one
must find ways to use it to help others.  The NWS client certainly qualifies
as someone we can provide much help to.  The other obvious ones are for the
walk/ride/run events.  But when people ask me the real value of APRS, I have
trouble explaining much more than these uses.  I'm hoping to keep on
learning, though.

>else's posting except in the circumstance that a quotation is proper to make
>a point.
>
............. snip.........

Hi Jim,
  Point well made. And at the same time I have another comment.

   Many people are posting messages to the sig and signing off the messages
with their name only.
   My ISP shows all messages as coming from APRSSIG in the from header. If a
person sending a message only puts in their name, there is no way, thru my
ISP at least,  to send them a private response. I have no email address to
send them private mail. All reply are forced back thru the sig and wasting
bandwidth on the SIG. This means we are forced to read messages that apply
to one person only and are not appropriate to the whole SIG.

 ******  PLEASE USE YOUR RETURN EMAIL ADDRESS IN ALL MESSAGES  ********

   When posting messages, if you think its appropriate for everyone to read,
post it to the sig, if not send it privately.

73,

Roger Sellers

I too had problems with the mail item APRSSIG: 6396. This was about
the eighty fifth message in a batch being downloaded , it caused the
mail program to crash with the loss of all the bulletins. Using
Internet Explorer Mail program I couldn't log back on to my ISP.
Tried another machine and Eudora and all was OK. Re loaded Internet
Mail , cleared the IN-Box and now running normally apart from having
lost the mail items.

398. Trimble Ant. for GPS45

From: jud <judlynn@norfolk.infi.net>
Date: Sat, 16 Nov 1996 16:40:39 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <199611162140.QAA12091@mh004.infi.net>
Rendered body type: text/plain

I had been taking the the antenna that came with the Garmin GPS45XL and
mounted it on the roof of my pickup truck, it worked quite well. This past
week I received the Trimble antenna for the GPS45 from PaCComm that has been
discussed here on the SIG. What an improvement there is on the satellite
page. The bar graph shows more satellites and much stronger signals. The
small size of the antenna is an added plus and installing the BNC connector
was no problem. I can thank the SIG for the good tip on this antenna.
Jud, KE4HFX

Tom,
  You are so correct on the legal aspect of the BEACON issue. Several
years ago I had the opportunity to contact Norfolk Field Office about
the same thing, and I got the same answer but with a twist. The Engineer told
me that I didn't want to make to much noise because they were just looking
for a TEST CASE. Well I shout up. And after that 900 phone number thing that
I know that you remember, the Norfolk office sent an Engineer out this way to
monitor UNCONNECTED PACKETS. Well I think that the rule applys as you say
                            DON'T ASK

>be able to search them by topic.

If you have WWW access ( and who doesn't these days).

Go to the www.tapr.org site and look at the APRSsig mail archives.
You are going to get a month's worth of mail , but then that
is what a text editor FIND command is for. I think I just ended
a sentence with a preposition.  :-)

You can use e-mail only to download the archives, just ask
the listserver for help with the formatting.

You should be able to get the APRS files via e-mail only,
if you can get the correct path names to the file.

I will be in Kansas City Monday evening for diner with any APRS people interested.

Jim Duncan has graciously offered to 'coordinate' this.

Jim will announce where, but the current plans is for an 8:00pm dinner on Monday Evening. I expect to be at the restaurant by 7:00pm.

Jim will be announcing where we will be meeting..

ALso, due to the fact that I am out of town, my e-mail response will be spotty for a few days.

The Kansas City APRS Working Group will host a dinner/get-acquainted session
with KEITH SPROUL, WU2Z, (co-author extraordinaire of WinAPRS and MacAPRS)
on Monday evening, November 18th.

Time and place will be announced to the SIG on Sunday evening immediately
after the KCAWG weekly net (146.79 voice -600, 2000 CST) when we all decide
where to meet!

We are pleased to have Keith joining us for an evening in Kansas City as he
travels through the Midwest on vacation!

>In a message dated 96-11-15 14:55:46 EST, you write:

><< schiers@ames.net >>

>So, I'm to understand that you're using a U-2000 with WinAPRS and it's
>seeing and sending wx packets? I've tried everything and have not gotten
>WinAPRS to display weather info and/or transmit it.

In short, yes. Let's make sure we are comparing apples and apples. I have run and continue to run WinAPRS since version 1.00 with a U-II and then a U-2000. The initial configuration was:

Win95, AMD DX2/80, 12 mb RAM, 800x600 cirrus pci video, 65K colors, U-II

next

Win95 + Service Pak1, Same CPU, 20mb RAM, ditto video, U-2000

current:

Win95 + Svc Pak1, Pentium 133, 32mb RAM, Diamond pci vid, U-2000

I receive and tx wx perfectly. In early versions, WinAPRS would not auto transmit wx, but it was reading the data properly and had to be manually sent, i.e., Settings > Transmit Weather. That has been fixed for the last several versions.

I am running an AEA DSP 2232 dual port tnc in gateway service between 30m and 2m.

Until this version, 117, there has been a consistent bug in wx decoding of STAND ALONE systems. They appear to have fixed part of the problem, but I still don't think it is parsing all of the data properly from stand alone wx stations (not running aprs).

In addition, WinAPRS still does not remember the VHF wx transmit interval if you change it. It defaults to 30min, and I have to change it to 15 every time I restart the program. This is a known bug, but low on the priority list for fixing. (It's been there since version 1.00)

************ IMPORTANT ***********

Make sure you are running your U-2000 in the FULL DATA output mode. Do not select packet mode or any other mode. Neither DOS or Win APRS will work if you don't have the data mode set properly in the U-2000.

****

As of a version or so ago, DOS APRS would still not work properly with my system. For many, many versions dosAPRS has been hardware dependent when using a U-2000. It has serial port problems with some hardware configurations that seem to relate to having high speed FIFO'd UARTs. The symptom is "buffer over-flow" error messages.

>Set as 2400 baud, the data is visible in the WINAPRS Terminal, WX window,
>but does not show in the Weather Display within APRS or transmit.

I see the wx in terminal mode if I look at that port, and as mentioned above, I display, transmit and receive all wx info, with the caveat about properly decoding stand-alone wx systems.

>Even Keith Sproul said they knew they had a problem and the hoped to get
>it fixed soon. As I said, the Peet Tech guy said they had had no luck in
>getting it to work either. Strange that Keith thinks they have a
>problem.

Maybe they do have a problem, similar to Bob's problem with dosAPRS, i.e., it works with some systems, but not with others. I can only say it works with mine, and always has (since they first claimed support for the U-2000). This means it has worked with two different motherboards, two different video cards, three different memory configurations, and both with and without the Win95 service pak.

>Well, hope 1.1.7 makes a difference!

>Ken

OK...now after all of that...did 117 make the difference for you?

418. METEOR SCATTER last night!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 17 Nov 1996 11:03:39 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.961117105433.22634A-100000@arctic>
Rendered body type: text/plain

Before your HEARD log gets too old, look at your MAP and heard log closely. The Leonids were supposed to peak last night at 2 AM. I saw 4 possible MS contacts on my map this morning. (Just plane old APRS, not MS mode).

You will not be able to prove they were MS, because all of them of course had digi paths on them, and of course, I heard them via the last WIDE (cant be avoided since I am surrounded by WIDE's! But here's why these are suspect:

N8AJD-10 digi in Ohio. path 450 miles. path was W,W over mountains so no tropo..

WA4SSP   WX stn in NC. path abt 450. path was w,w, over mtns, etc

RACES   RACES stn in NC... same as above

ARGH! Even though the asterix was by the last WIDE, I FORGOT to luck at the left column on the heard log to see if I had also heard them direct!

The only otehr time I have ever seen any VHF stations in Ohio was during the Persieds 2 years ago.

Conclusion: There were bound to be some MS DX packets, even though they may also have hit a digi or 2 along the way. Look on your map for contacts more than 300 and less than 1200 miles that are new, and then check it out..!

Since other people echoed Roger's complaint...

Some e-mail software allows you to show either an abbreviated version
of the message header, or the whole thing. If you show the entire
message header, you will see the address of the originator.

For example, with Juno, you pull down the "OPTIONS" menu and click on
"show headers".

I have no problem finding private return address. It is embedded in header.
With Microsoft Exchange , highlight name of sender after the APPRSIG with
mouse. A right click opens a small window and clicking "properties" show full
e-mail address. While it is highlighted u can click 'edit' 'copy' and have the
address ready to 'paste' into any private reply. Highlight only the name and
no spaces before and after.
  This was discovered by stumbling around. Microsoft's help files were
useless.

425. APRS in 73

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 17 Nov 1996 12:43:12 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.961117123701.23896A-100000@arctic>
Rendered body type: text/plain

APRS is the feature article in 73 magazine December issue. I submitted it
in Feb 1996, so dont take it as the "latest word" in APRS, hi hi

And the full screen color graphics sure look weak in black and white. But
you can refer your buddies to this article if they want something to read
about APRS...

P.S. if your call typically shows up in some of my favorite BACKUP files,
then you will probably see your call on the maps! Get a copy for your
scrapbook!

In WIN31, if you invoke APRS from a PIF file (copied from the PIF that
invokes the DOS prompt), APRS behaves properly when in DOZ mode and then
minimized with Alt-ESC.

I am not sure  how you mimic the PIF file in WIN95, but that may give
you something to research.

Hi Joe, I use Eudora 1.4.3 and this does not allow such configuration. I
plan to purchase the newest Eudora Pro soon. Maybe this will be the fix, but
I suspect its from my IP. But thie simplest solution would be for all to
just include your email address along with name and ham call. Concider it a
courtesy.

431. Re: DOS APRS in Win 95 backround.

From: Anthony Hickey <fhickey@neosoft.com>
Date: Sun, 17 Nov 1996 13:51:16 -0600
To: aprssig@tapr.org
Message-ID: <328F6CB4.303C@neosoft.com>
Rendered body type: text/plain

```
I run DOS APRS in windows backround almost 24/7 using the windoz
feature.  everything seems to work well and most the data goes through
(I lose some when running CPU hogging programs in the foreground), but
there is at least one program that I know of that turns on the "always
suspend" feature under the misc. properties.  I end up with a H-list
with several Hours missing even when this program is idle! and all the
stations are completely grayed out, and I obviously get very
frustrated.  I have also disovered that minmizing APRS causes it to
cease to collect data, other programs do that also such as Eudora when I
have new mail. (I use Netscape mail now)
I have a utility that displays percent CPU time used.  APRS dozing in
foreground is about 80%, backround 35-50% , and minimized is pretty
close to nothing. The program almost always shows some CPU idle time as
well.

OK, so what I want to know is if there is a way to permanently turn off
the "always suspend"  checkbox and not let other programs interfere when
it is running full-screen?

                                        Thanks, Anthony AB5QR

PIF files are still there. Microsoft hid them under "Properties" (right button mouse click on the object).

There is more dos and windows 3.1 stuff in 95 then you think.

I guess that this is what I tried to say in my first message, that the
DOS APRS program works fine running minimized if you first hit the F10 key.

I have since gone to WIN APRS on my WIN95 computer because I also run
WISP for my satellite programs.  I don't want to continually run APRS in
the background where I can't see it running, so the only solution was to
change to a program that is compatible with the time slice environment
that Windows provides.

I prefer the ease of operation that DOS APRS offers.  I just wish that
the DOS version could live in a DOS window in WIN95 while running other
programs, such as my WISP, in other windows.

APRS is wasting a lot of CPU time just waiting for the keyboard or serial
port.  Someone who is smart in QBasic once sent me a note that if you call
INTERRUPT XX when your program finishes its tasks, that that will allow
WINDOZ or other multi-taskers to steal the CPU immediately...  This would
be easy for me to add, if that person would again remind me how to do
it....

Im just uploading the upgrade file tonight for a quick look before
comitting tot he full version.  This versions attempts to correct a few
small bugs.  If you have reported one of these bugs, plese leemme know if
I fixed tthem:

Ver 77e:
* 77d would not let you use your 12th OPS-DIGI call.  FIXED
* If you have MAPS-FEATURES-CALLS off, then WX info still shows...
* MAPFIX28 shows the name of the map you are working on on top of screen
* If ur 1st msg is to REPLY it will be sent in reply to all incoming msgs
* New MAPS-WHICH command will list all XXmapsXX.ZIP distro files that
  you have loaded into ur MAPS directory (if the distro map-maker included
  a file by the name of XXmapsYY.TXT in his MAPS directory).
* Now, just hitting the MAPS command will display the current map NAME
```

  in the upper right corner. Just hit return to finish the menu.
* Added INTFACE TERMINAL to INITTAPR.TNC to properly init KANTRONICS
* Tried to fix GPS mobiles sometimes going to a BUOY symbol
* Now show AVG-GND-LVL on TAB control bar for debugging Davis-BARO
* POSIT changes now properly overwrite the POSIT comment field.
* New maps for Grand Rapids MI, Reading PA, Neast colorado

I will be uploading the 76to77e.zip file beginnning now...

I have been runnning the Trimbl eantenna since Dayton on the GPS-45 and have seen no problems, just
better signals. I run it straight into the receiver, no attenuator.

There are some others in the area using the Trimble antenna and GPS-45 around here. No reported
problems. They work well together.

I've been running various external antenna's with the gps45 with no problems other than blowing the fuse in the garmin power cable when I accidently shorted something out. Have used the Raytheon, Garmin, amplified antenna's along with the patch antenna from QST, and now the Trimble one from Paccomm, boy that is a nice small high gain antenna, shure makes the other's look sick in size, and rfi from radio xmitters is down considerably from the other's.
I just cut the coax and put a bnc crimp on connector or and away we go...

I didn't send the original, but this is what you want. This is sent to both Bob directly and to the List (just in case anyone wanted to know how to tell windows that the current program is just sitting there!)

BTW, this is from Ralf Brown's interrupt list -- excellent resource for programmers like ourselves.

```
----------------------------------------------------------------------
INT 2F 1680 - MS Windows, DPMI, various - RELEASE CURRENT VIRTUAL MACHINE TIME-SLICE

Category: W - MS Windows

Inp.:
        AX = 1680h
Return: AL = status
            00h if the call is supported
            80h (unchanged) if the call is not supported
Notes:  programs can use this function in idle loops to enhance performance
          under multitaskers; this call is supported by MS Windows 3.0, DOS 5+,
          DPMI 1.0+, and in OS/2 2.0+ for multitasking DOS applications
        does not block the program; it just gives up the remainder of the time
```

```
          slice
        should not be used by Windows-specific programs
        when called very often without intermediate screen output under WIN 3+,
          the VM will go into an idle-state and will not receive the next slice
          before 8 seconds. This time can be changed in SYSTEM.INI through
          "IdleVMWakeUpTime=<seconds>". Setting to zero results in a long wait.
SeeAlso: INT 15/AX=1000h,INT 15/AX=5305h,INT 21/AH=89h,INT 7A/BX=000Ah
INT 2F
```

This will _definitely_ make APRS more windows friendly. I've used
this in other programs and have seen processor usage go from 100%
to under 3%.

Well I have to fess up but it is hard. I too have been getting dumped out
of my
Microsoft Explorer mail program, and learned early on to just go to my
wife's Mac
(running Netscape 2.0) and I could download it fine! Once the list was
cleared I could
go back to my Bill Gate's wonder program and my PC. First I had to take
my wife's
ribbing about Mac superiority, and now I confess publicly!

There is apparently a change in procedure or a problem with the TAPR ftp server.

I uploaded a new version of AutoWx and found the same problem - the file is inaccessible.

(BTW Bob... My first upload of this update was incomplete, also - maybe we can blame the server for the "blown" uploads this time.)

One of the uses of APRS is on board sailing vessals. We started to
see it this summer and expect to see more APRS on board the Transpac
- LA - Hawaii races in the future. It is also handy for informing
your family where you are when you are on a cruise, for example going
to Mexico.

460. Change in FTP Access on TAPR.ORG

From: "Greg Jones, WD5IVD" <wd5ivd@tapr.org>
Date: Mon, 18 Nov 1996 15:43:36 -0600
To: aprssig@tapr.org
Message-ID: <v03007803aeb67de13458@[128.83.113.85]>
Rendered body type: text/plain

```
Several have commented on the change on the FTP site.  An emergency change
was implemented by Lee, N5LYT, TAPR.ORG system admin during the weekend in
order to stop the illegal use of TAPR.ORG by a group of software pirates.

We had several messages end of last week noting the fact that FTP access
was full all the time.  Even when we upped the access to 40 users, it
filled up.  Upon close inspection it was determined that some 200 Megs of
illegal software had been sneaked into the software_lib/upload area.  In
```

addition, once we found this problem and removed the files, one of the pirates accessed the software_lib/upload area and deleted all the files that had been placed there by amateurs. Easy enough to do with the permissions we had setup -- since it was setup for honest folks.

TAPR.ORG is now setup as follows for all open anonymous upload areas, which now includes the aprssig/files/upload area:

* No subdirs in the upload area can be created
* File names can only use the characters "A-Z", "a-z", ".", "-", and "_".
* File names may not start with "." or "-"
* FTP users cannot delete, overwrite, or modify files once uploaded
* Files uploaded there are owned by "k9orp:aprsftp" with mode 0660.

This last statement means that anyone can still upload a file to an upload area, but no one can read the uploaded files until someone (either k9orp or any member of the aprssig ftp group) changes the permissions on the file (and hopefully moves it somewhere else).

Larry Keeran, k9orp, is now acting as full time APRS FTP library manager and we are working on getting Larry up to speed on how to access his account and move files around and generally keep the library in clean and orderly shape. Larry has been doing this in an ad-hoc fashion for several months, but after this weekend we decided that it really needed to be done officially with an account being issued.

When you upload a file to APRS upload area, you will need to __send a message__ to k9orp@tapr.org or the address listed in the README (which is now directed to Larry). In this way, Larry will know when files are there and can either move them or make them readable until he can move them. Also, be sure to include the .TXT file that Larry requested during the summer. This helps him and others later know that the files contains. If you have a specific area you want a file moved to, then let Larry know.

Bob B (APR) and Keith S (Z) both have access to their software dirs and should be uploading updates into those area directly. In this way, software updates should be available immediately. I'll touch base with both of them again and make sure we all have the right accounts and passwords to be doing that.

I will go ahead and change the permissions on all files currently in the aprssig/files/upload area for access. Any future files uploaded to the area will need to be changed by Larry for access after he gets an e-mail from the uploading person.

I figure Larry will post more as he get the backlog of files moved around and the files on there made readable.

Sorry for this additional security, but now that TAPR.ORG has been targeted as a system that can be used for illegal uploads like we had this weekend, Lee really had no other choice than to add these safeguards.

With this change, we have also bumped up the access for anonymous ftp to 30 users.

Cheers - Greg, WD5IVD
Pres TAPR.

The very propritorious Delorme is offering upgrades to Streets
USA Ver4 for $25. Also the Sell a package called tripmaker that
includes a GPS unit and Ver 4 Streets USA. I have been unable to
contact them for info on this GPS unit to see if it sends out
standard NMEA sentances or if it is more propriotry stuff.
Ver 4 of Streets has many new features. You can draw on the maps,
measure distances with your mouse, download maps to a pc that doesnt
have a CD player. From the internet you can get WX info that will
display on the map. Highway construction info is also available via
internet.

Does anyone have more info on this? At $125 Tripmaker/GPS sounds too
good to be true.

Well I just ordered the Tripmaker from Delorme for $125.00 (Upgrade)
only. and at the site below it claims to support the following GPS
receivers.

Delorme Tripmaker
Garmin GPS-30, 45 or GPS II
Trimble Scoutmaster
Rockwell or a fully compatible NMEA receiver

So from what I read nearly all GPS receivers are supported, so if you
have an older version and you have received an upgrade notice you can get

the Street Atlas USA 4.0 for only $25.00 and should work with a GPS receiver.

The following sites will give you all the info:

http://www.delorme.com/products/tripmate/
http://www.delorme.com/products/gps/

>good to be true.

I saw this at my local CompUSA for $179 not $125. The package stated that
the software would only run with the included GPS receiver. Either they are
mistaken or have created a proprietary GPS receiver.

FWIW, gang -

I monitor the forum through the listserver digest, and do have to comment that
we've been seeing more than the normal number of binaries passing through
lately. Binary attachments get changed to binhex(?) text in the digests, and
only the massive (>1MB) binaries cause my particular reader to upchuck.

The summarizer doesn't post the message numbers so I don't know which one was
#6396 (or 6397), but maybe someone whose mail reader didn't self-immolate can
tell us what that particular message had in it and we can back into the
problem. Maybe an inadvertent attachment or a sig-line animation gave certain
readers terminal [pun intended] indigestion.

and then Arte queries:

> Is there such an animal that'll help us PC-types
> make WinAPRS maps from the USGS DLG (Optional format) C-D's?
```

To both I have to reply, "Not that I know of." I'm not familiar with whatever system uses the Arcinfo format, but if it's a commercial system (versus public domain, like TIGER and DLG), there are all sorts of dance steps that might have to be taken around intellectual property issues. This even extends to the file formats themselves.

To the Windows/PC/Intel map generator, no, and it's going to take one of us to write something. Unfortunately, I still have no intentions on porting MacDLG to Windows. For starters, because of the screwball language I've used (a Mac-specific super-BASIC) the source code's not very transportable. I also don't have anything better than a 286 at the house, and SoftWindows (x86 emulator for the Mac) is a miserable environment to program in. Professionally, I design and write for both platforms, but prefer Mac because I can concentrate on the solution and spend a lot less time fighting system management issues.

And... just maybe... there's a part of me that wants to help make up for the incredibly poor support that the Mac platform has seen from the ham software community. If because of MacDLG there was even one serious APRS devotee that considered investing in a Mac over a Wintel box because it has better overall support (or had a better end result for their application), then I'll consider the resultant mind-broadening a mission accomplished.

FWIW.

483. Scanning Maps for APRS

From: ke6nyt@fishnet.net (Dan Dicke)
Date: Mon, 18 Nov 1996 22:16:51 -0800
To: aprssig@tapr.org
Message-ID: <199611190616.WAA06411@big.fishnet.net>
Rendered body type: text/plain

If one were to scan in maps is there a way to get it digitized from a
scanned in version? I am trying to get APRS started here in Ventura County
Cal and think I have a way of doing that will get a WIDE up on Sulpher
Mountain where our main repeaters are. This would cover 90+% of the county,
also reaching to Pasadena which I think is the closest WIDE to me. This in
turn would connect to LA and San Diego Counties.

If I am able to pull this off, there is a gentleman in Santa barbara
county that I spoke with that is the ARRL Section Tech head that will put up
a WIDE in SB county. This will get APRS on the west coast from the Mexican
border to about center state. Northern CA is already on line, but on
145.010. We will cross that bridge when we get there.

Anyway, back to my original question, can we scan in maps and get them
convertered for APRS? We want to use it for ARES/RACES and that will give
us the OK to set up a WIDE.

Thanks for the time and space on the sig.

>scanned in version?

We MacAPRS users have had the option to use scanned map files for some time.
I use screen captured PICT maps from Delorme SA2 and SA3.
It should be in WinAPRS also.

MACGPS PRO works well displaying GPS position data and maps. A new MAC
program GPSy 1.5 will let you use SA3 CD-ROM directly with a NMEA GPS
to plot you position as you move.

---- from the readme----
GPSyLink provides a seamless connection to DeLorme's StreetAtlas® 3.0. You have a moving map display with advanced control features such as control over zoom in/out; magnitude; map features; and update rate -- all from within GPSy.

This is not a 'bug' or problem with UNIX, it is a feature! And if you received the msg about the problems at the TAPR site you can see that it is a very useful one for system administrators. It is not in search of an application, it is applies every day in thousands of applications around the world. Being able to designate read, write, and execute permissions is one of the 'powers' of UNIX/Linux. It IS a very different animal than DOS/Windows and other operating systems, and I would say is more difficult to learn (at least for someone who has DOS expierence) but overall is much more powerful. A true multi-tasking OS.

I'm sure most of you have heard of Linux, which is basically a free version of UNIX that will run on desktop machines (i836 or better, min 4MB ram). Some day a Linux/UNIX version of APRS will appear, and all the OS users will droule over its capabilities. Wouldn't you like to have up to 8 virtual consoles on one machine? Each doing a task at the same time? APRS-X (the name I have coined for the future X-Windows version of APRS)in one windows and your UL-200 datalogging program running in another, all while you run Netscape on a third and maybe TNOS on the fourth console?

What I think would be cool is a TCP/IP version of APRS, this would work over a SLIP or PPP connection or packet TNCs.

Keith & Mark I though had a APRS-X version on the back burner. I know of many Linux users who can't wait for its appearence.

The map making program that Keith and I are working can deal with ARC-INFO files. The program is currently Mac only and is a long way from release quality. It is what we use to make all of the maps we put on the CD-ROM

For some time we have been making street level (from 100,000 USGS data) maps for anyone who asks, We put as many of them as we could on the CD-ROM, and most major popluated areas are covered.

It is called "X-APRS" and it is a REALITY, we demoed it at DAYTON of this
year (yes, last May).  We already have maps displaying on a Sun, we will be
doing linux, both Mac Linux and PC Linux first.  We HOPE, (this is not a
promise) to have it ready to release by Dayton of next year.  I am keeping
track of the names of all people who express interest in X-APRS,

It is not in WinAPRS, Windows does not support PICT files and the entire
issue of handling bit-map images is MUCH more difficult under Windows than
on the Mac.

To: aprssig@tapr.org
Message-ID: <2.2.32.19961119163438.00c20d00@cassatt>
Rendered body type: text/plain

It was a slow night surfing the local cable system last night, and I came upon CSPAN-2 doing a press conference with some NOAA people talking about Space Weather and predicting it. It was really discussing the effects of the much anticipated upcoming Solar Maximum Sunspots, and the effect of Solar storms on us.

Much of the program was dedicated to the Power generation issues with solar storms, and Space issues, but the one nearest and dearest to many of our hearts on the SIG is that people who use single channel GPS receivers can expect problems during a solar storm of larger magnitude. Sounds like the varying density of the atmosphere caused by such solar storms makes the paths to GPS satellites harder to measure.

This is much more a problem for Pilots or Mariners than your typical GPS/APRS Ham installation.

Anyone else catch this?

As they say... "if it sounds too good to be true, it probably is." I also received the DeLorme brochure in the mail yesterday, and it looked interesting, but after checking their Web site, I noted the following:

1) Their GPS receiver is "not compatible with other GPS or mapping

applications", which probably means it's not putting out NMEA. (But the Street Atlas 4.0 software will accept NMEA sentences, if you already own a Garmin or other NMEA rcvr)

2) It looks like the receiver will only run on four AA batteries, which need to be changed every 10-14 hours. There's no power switch, it's controlled through the data port and turns on when you start the DeLorme program (another clue that it's a proprietary data format) The first thing I would want to do is modify the unit to run on external DC...

3) The special introductory offer was made to people on DeLorme's mailing list, and may not be available in retail stores. They can probably sell the thing cheap because they're getting a kickback from Duracell and Energizer, hi!

4) Hey, if Bob can figure how to decode their format, maybe there's a way to use the DeLorme receiver for APRS, with a portable PC to "translate", but don't expect to use it in a standalone configuration...

Anyone heard of the Jupiter GPS board by Rockwell using a Zodiac chip set?
Same as the GPS-20?

I need this for a Super Loki Rocket Launch.

After several months, Im kinda getting tired of seeing XXXX-3 on my bulletin page every day taking up 2 lines just announcing his presence. That is what the STATUS beacon is for. Also, he is using GATE,WIDE,WIDE which is also not good policy, READ HF.TXT for several reasons why this is bad. I have tried sending messsages to him on both HF and VHF, but never get any acks...

So now Im asking if anyone in the Boston area can make contact with this station and see if he understands what he is doing. Remember he is obviously running some homebrew software since he was also the station that was GATEing everything from HF to VHF and using his software to add GATE,WIDE,WIDE,WIDE to every packet a few weeks ago....

ALso, I dont need to see every Kansas CIty VHF digipeater on HF.... We know they are there, why waste the bandwidth? DIGI-W.BK should show all of those digipeaters... Since there is obvioiusly a GATEway there, we should be seeing it, not the WIDES.... Thanks.

Soap off...

497. ***** Change in FTP Access on TAPR.ORG *****

From: "Greg Jones, WD5IVD" <wd5ivd@tapr.org>
Date: Tue, 19 Nov 1996 11:40:44 -0600
To: "APRS SIG list   mailing"<aprssig@tapr.org>
Message-ID: <v03007805aeb79c05e58e@[128.83.113.92]>
Rendered body type: text/plain

Based on messages posted after I posted the first version of the message below, doesn't look like everyone read the message.   So, here is a shorter version of the message with some updates. Check the messages posted yesterday for the full version.

Cheers - Greg

--------

TAPR.ORG is now setup as follows for all open anonymous upload areas, which now includes the aprssig/files/upload area:

* No subdirs in the upload area can be created
* File names can only use the characters "A-Z", "a-z", ".", "-", and "_".
* File names may not start with "." or "-"
* FTP users cannot delete, overwrite, or modify files once uploaded
* Files uploaded there are owned by "k9orp:aprsftp" with mode 0660.

This last statement means that anyone can still upload a file to the upload area, but no one can read the uploaded files until someone (either k9orp or a member of the aprssig ftp group) changes the permissions on the file (and hopefully moves it somewhere else).

Larry Keeran, k9orp, is now acting as full time APRS FTP library manager and we are working on getting Larry up to speed on how to access his account and move files around and generally keep the library in clean and orderly shape. Larry has been doing this in an ad-hoc fashion for several months, but after this weekend we decided that it really needed to be done officially with an account being issued.

When you upload a file to APRS upload area, you will need to __send a message__ to k9orp@tapr.org or the address listed in the README (which is now directed to Larry). In this way, Larry will know when files are there and can either move them or make them readable until he can move them. If you don't let Larry know about the file, then it will wait until Larry discovers it. Also, be sure to include the .TXT file that Larry requested during the summer. This helps him and others later know that the files contains. If you have a specific area you want a file moved to, then let Larry know.

Bob B (APR), Keith S (Z), and Steve Dimse all now have access to their software dirs and should be uploading updates into those area directly. In this way, software updates should be available immediately. Those areas are:

DOSaprs
ftp://ftp.tapr.org/tapr/SIG/aprssig/files/dosstuff/DOSaprs/

MACaprs
ftp://ftp.tapr.org/tapr/SIG/aprssig/files/macstuff/MacAPRS/

WINaprs
ftp://ftp.tapr.org/tapr/SIG/aprssig/files/winstuff/WinAPRS/

javAPRS
ftp://ftp.tapr.org/tapr/SIG/aprssig/files/javastuff

Any future files uploaded to the _upload area_ will need to be changed by Larry for access _after he gets an e-mail from the uploading person_. Larry is checking daily for messages, so if he gets a message about an upload, it is a simple task for him to pop over and make it available.

Greg Jones, WD5IVD
Austin, Texas

The MacAPRS 2.6.7 has a Receive Only TNC option that is designed to connect with telnet nodes like "www.wa4dsy.radio.org:14579" using TCP/IP. This works great. I use it to check how local stations, in Nashville, are propigating to

Atlanta. I would love to see this technology expanded to other cities. I would
also like to see a server that would consolidate all the cities to one node.

Thanks Keith for the software, thanks Dale for the node.

Lots of info about this on the sci.geo.satellite-nav list

From: ke6zc@netcom.com (Stan Slonkosky)
Newsgroups: sci.geo.satellite-nav
Subject: Re: Delorme Tripmate GPS for SA 4.0
Date: Thu, 14 Nov 1996 08:39:42 GMT

Randy Davis (randy@agames.com) wrote:

> So, does anyone have any experiences or more info than is contained on the Delorme web page?

Not much in my case. I ordered it on Monday for $125 as an upgrade to SA 3.0. The upgrade for SA 3.0 along would have been $25, so the GPS essentially cost $100. I also ordered the 3D Navigator program for $19, but I haven't loaded that up yet. Total cost was $144, which included 2nd day air shipping.

> [I didn't come across the picture of a GPS unit mentioned by the original poster during the approx 10 minutes I spent wading through the site. On the page "http://www.delorme.com/products/tripmate" is a yellow-looking thing that might be the GPS unit.]

It's yellow all right. It's really strange that there's no power switch. You must either pull out one of the batteries or disconnect the Berg connector that connects the batteries to the GPS itself. The bottom part of the shell holds the batteries in place is attached to the top half with two screws. You can use a dime or a penny to unscrew them if you don't have a screwdriver handy. A sticker on the bottom of the top half of the unit says there are no user serviceable parts inside and that opening it voids the warranty, so I didn't open it.

There is mention of an external power supply being available from Delorme so you can run the unit from a cigarette lighter. I don't know why there is no reference to that on the WWW pages or on the mailer I received. Of course, one could get a a six volt supply from somewhere else and make one's own connections.

I didn't have a chance to test it in the field yet and won't until I can get the display on my notebook computer replaced, but the unit does appear to work as well as I might expect inside my living room. I'm sure that if I got a long enough serial cable that I could put the GPS unit outside I'd get better results.

I notice that at least one error remains on SA 4.0 remains. I first noticed it with SA 2.0 and it still hasn't been corrected and that's the bridge across the Colorado River between the north end of Laughlin, NV, and Bullhead City, AZ. Part of the bridge has been broken off and placed downstream about half a mile where neither end of it connects to any other road. A couple of errors I noticed in SA 3.0 have been corrected. Orangethorpe Ave. in Orange County, CA, is finally one word (instead of Orange Thorpe) and a street I used to live on south of Globe, AZ, in Six Shooter Canyon, is now correctly shown as Winchester Dr (instead of Winchester Rd). I think the above errors originated in the Tiger database, because I've seen the same errors on CD's from Precision Mapping, one other publisher whose name I can't recall and the Tiger WWW pages (though I haven't looked there in several months to see if things have been corrected).

From: "Eric A. Cottrell" <eac@shore.net>
Subject: Re: Approximately 100.00 US dollar GPS receiver (more)

Hello,

The unit seems to lock on the satellites reasonably fast.   I downloaded the New England area onto my laptop and the moving map display is neat.

I hooked it up to a comm analyzer and played alittle. Communications are 4800 baud using ASCII characters so far. The serial port does not assert handshaking signals so hardware handshaking should not be used.

Power control appears to be the DTR line. Asserting DTR powers up the unit and it sends three NMEA messages (PRWIRID, GPRMC, and PRWIZCH) then keeps sending a non-NMEA character string until it receives a $IIGPQ message with the character string. I was able

to program a function key on the windows terminal to send the string and NMEA sentences poured out of the receiver.
NMEA messages begining with PR are reserved for manufactuer's messages.

Some of the NMEA sentences:

PRWIRID	seems to contain version numbers and dates
GPRMC	position info
PRWIZCH	twelve sets of what seems to be satellite PRN and a single digit code
GPGSA	Number of satellites and PRN numbers plus some other info.
GPGGA	Position and other information.
GPGSV	Usually three messages in a row i.e. gives info on only 4 sats? Seems to be satellite info such as az/el

I need to check my nmea info as the GP messages are a standard format.
I also need to log the output as no doubt almanac and other messages are sent.

Stan Slonkosky wrote:
>
> Randy Davis (randy@agames.com) wrote:
>

Thanks for the pricing info... its a REAL bargain imho

> It's yellow all right. It's really strange that there's no power switch.

Yup it YELLOW.. you can see it half a parking lot away, just screaming "Steal me !!"

The CTS line goes false, turning off the power, the software or the turning off or disconnecting the computer takes care of it.

> You must either pull out one of the batteries or disconnect the Berg
> connector that connects the batteries to the GPS itself.

NOT NEEDED...

I've been using one for a couple months now right beside a Garmin GPSMAP130 and an Accunav (beta test) and it's as hot as any of the expensive receivers. It's actually a 12 channel (Rockwell guts, Trimble made) parallel, and aside from the initial slow startup, is excellent.

The SA4 is wonderful, loads maps on the hard drive, runs without the CD, and aside from the short bread crumb trail is the best I've used. The maps are a little better than they were.

All the G45 functions a OK with the GPS130 by the way. The Accu-Nav is fine, and Trimble CM3 modules are OK, but CM2's don't output the *NN cksum needed.

It is also very cooperative with MNG2..

Hello,

I read some more about NMEA 183 and realized I made a mistake.
I thought that the first two characters were used for the reserved messages. It is the first character. The RWI indicates, I believe that this unit is a RockWell International engine.

The other interesting thing is the response from the SA 4.0 software has

a source address of II (Intergrated Instrument) so it looks like you have
to send NMEA sentences for at least some commands. I do not see a
listing for a GPQ sentence.

I would not be surprised if the "non-NMEA string" being sent on powerup
is a NMEA method of getting attention and the GPQ message is an
acknowledgement. In that case it may be unusual, but following the NMEA
standard would tend to run counter to the statements that the Tripmate
Receiver could only run with SA 4.0.

Did I let the cat out of the bag? Maybe, but knowing this group
someone would have figured it out.

>   The CTS line goes false, turning off the power, the software or
>the turning off or disconnecting the computer takes care of it.

Hello,

Actually I found that when the DTR line goes false (or disconnected) the
receiver powers down.

I did some research based on the fact that the PRWIZCH and PRWIRID
NMEA sentences where mentioned in the Rockwell protocol thread.
I assume that RWI stands for Rockwell International. The thread mentions
that ZCH stands for Zodiac Channel status.

Searching the Rockwell site turned up press releases from earlier this year
about a 12 channel GPS receiver implemented with 2 ICs. It is called
Zodiac and the evaluation board is named Jupiter. It is designed as a
high-performance, low-cost GPS solution.

I noticed today looking at the NMEA output on power-up that the real-time
clock is not used as the receiver alway starts near 0000 utc. The receiver
also uses all 12 channels to search for one satellite and starts at about PRN
16. It only searches each satellite for a couple of seconds. If it gets a
"hit" it keeps the satellite on that channel and continues on. It looks like
this type of search ends when it gets the almanac. It also looks like the
almanac is not stored as well as GSV sentences do not start get outputed
until after it receives the first satellite. It also starts outputing only
one GSV message for the first satellite, then a while latter it starts outputing
2 or 3 GSVs with information for all satellites above the horizon.

The only question is what the IIGPQ sentence that is sent from the computer
means. I know the II part means Intergrated Instrumentation.

Bob - the heck with using the receiver...   Let's figure out a way to use
the map CD.

Now that is a challenge, I ordered my Street Atlas 4.0 over the weekend.

Weren't the Sproul's working on software to utilize this CD????

I would pay real money for a program like that!

Yes, the Jupiter is a 12 channel OEM receiver with NMEA output. Very nice.
Has a low power sleep mode, fast acquisition, etc.

PacComm is offering it as a premium option on some of our commercial GPS
products.

The antenna connector is an MSX or OSX (same thing).  In a few weeks
PacComm will have adapter cables which allow that receiver to be connected
to the Trimble antenna.

I used a solder on RG-174 BNC connector.  I had to ream out the center of
the sleeve section with a drill to allow the slightly thicker cable to pass
through, but it works great and you don't need the special crimp tool.

I used an AMP brand connector.

 Well, somtimes when you ask you may just get it. Try connecting to:

   sboyle.slip.netcom.com:14579

  This is my beta site for a Win95 Live Internet Data Service(LIDS) for
APRS. Its up most of the time serving packets from the south San
Francisco bay area.

  ALSO try --> http://sboyle.slip.netcom.com/LIDSAPRS.html

  This is a HTML page using Steve Dimse's JavAPRS applet connecting to
the same server.

  There is a "Master Node" server and other goodies in the works. Stay
tuned!

Steve

No, the Delomre Street Atlas is VERY PROPRIATARY, we did ask them about it
years ago and they almost threatened to takes us to court for even thinking
about it.

Percision Mapping on the other had is much more corropitive, I have the
stuff from them but it will be a while before it is done. Please dont hold
your breath, there are too many other things with higher priority.

Rendered body type: text/plain

My turn, Bob ! (And I agree, I can live without those port definations
just fine, thank you.)

Okay, my bit of soap. Please folks, as the interest in APRS grows,
30 M is getting busy, so we need to make the best use of the limited
bandwith we have. (That's the LAW up here, by the way.)

So please, unless there is a U.S. law that requires an Ident other than
that provided by APRS, TURN YOUR HID OFF.

I know its only one string that comes every 10 minutes, but with all of
us on there, it adds up.

Okay, I'll now turn the soap box over to give some one else a turn

vy 73 to you all, de John VE3NEC (john.langtry@resonet.com)

513. APRS/Java ..

From: bbliss@juno.com (William B. Bliss)
Date: Tue, 19 Nov 1996 16:11:45 EST
To: aprssig@tapr.org
Message-ID: <19961119.131039.2431.1.bbliss@juno.com>
Rendered body type: text/plain

Hi Siggers..

    Want to be able to copy the active APRS area maps, by APR,
ATLANTA, N2CZF and now our local Bay Area as mentioned on
sig., "LIDS for APRS"

My Windows is Ver.3.11, PackBell Pentium Force 341CD, with
Netscape Gold V3., for 16bit machines..
   Have downloaded the Win32S version designated PW1118.exe
2,471kb, but have not tried to load it into system.

   Have tried all of the JavaAPRS sites, and told V3.11 to read Java
but I always get foll:

    "   Sorry, your browser isn't Java compatable! ".......

Have been told Win32s and Ver3.11 don't get along and don't load
it, unless you have Win95.. With havin Pentium chip, been told
wont make any difference , will still work ok for JavaAPRS ..

   Anyone please, give me straight skinney... Do I have to have
Win95/Win32s.. to read our APRS active map units.. ????? Am
just a poor operator, not a computer expert, many terms over
my head...
       Thanks for any help, comments, suggestions. No flames pls..

    73's & Enjoy, Bill/WB6LPG bbliss@juno.com

>I would pay real money for a program like that!
>
>73, KM6YH
>

That brings up a question that I have. With all the talk about maps, I have
a mapping program on CD called Key Master Maps. They are nice maps and more
detailed than the Automap Pro maps (at least where I live), but the

publishers don't even know what a GPS is. I would love to be able to use them in the car with my GPS without buying any MORE mapping programs, but I know nothing about converting things like that. Is anyone familiar with this mapping program and is this a realistic possibility with APRS?

515. OLD Maps!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 19 Nov 1996 16:51:58 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.961119164359.7933A-100000@arctic>
Rendered body type: text/plain

I just discovered some old maps drawn to the old 1000 pt max limit:

CASanFrn.map
CAGilroy.map
CAObisbo.map

There may be lots more in other areas of the country.
I am sure you guys out there have better maps than this. Is W7KKE listening? What 3000 point map should I put in to replace these...? These are in my Wmapsxx.zip disto and pointed to by my MAPLIST.WES.

I havent updated my distro in over a year, so You guys have to update me when you get local better maps. But I cant fill my disks with high detail 100k maps either. Tell me what to do.

Similarly there are probably lots of old maps out there. If your area only gets a sparse map of under 1000 points, be sure to tell me. I am trying to weed out the old sparse maps... when I find them..

See APRS LIVE:

APRSdos REPLY/COMMENT: If you can access your telenet services in dumb terminal mode, then you can use APRSdos also by going to the OPS-COMM-TNC screen with a modem in place of your TNC, and then use the dumb terminal

screen to log onto your telenet host. THen when the data starts streaming
do an alt-X instead of the usual ESC to get back into APRS... and you
will begin to see the data plotted...

It was asked recently if we could get a message number of a message that
caused an Email program to crash (IE especially).
Today mine hung up on  # 6564. I was able to retrieve mail with netscape to
get the following header info

Subject:
         [APRSSIG:6564] Delivery-Report (failure) for
    Date:
         Tue, 19 Nov 1996 13:36:25 -0600 (CST)
    From:
         "X.400_Mail_Gateway" <X400Postmaster@resonet.com>

Hope this is of help.

Thom / kc7fzo
tmproehl@nwlink.com
```

524. Win95 Serial Port Problems

From: "Borcher, David (NG-MS)" <DBORCHER@nogmail.gi.com>
Date: Tue, 19 Nov 1996 16:05:00 -0800 (PST)
To: APRS <aprssig@tapr.org>
Message-ID: <32923B56@gismtpgate.gi.com>
Rendered body type: text/plain

```
I'm brand new to this SIG and APRS, so please try to take it easy on me...

I have 7.7b on my PS/1 running Win 95.  I can't, for the life of me, get
APRS to open a comm port to my TNC.  Other DOS-based programs seem
to do all right (I talked to the TNC via Procomm Plus, NOT the Win kind.)
I'm not really a big-time PC guru but I usually don't have this kind of
trouble
since I read doc files VERY carefully before jumping in.

What am I missing?
Thanks

Dave Borcher K7NG

The connector on the minature Garmin GPS antenna from PacComm is an SMB.
You can either cut it off and install a BNC connector or you can make an
adapter from a SMB jack, a short piece of RG-174 coax and an BNC male plug.
Contrary to common usage, SMB plugs are female and jacks are male.
```

Therefore SMB connectors are designated as plugs and jacks instead of male and female.

The SMB jack is AMP 414091-3, crimp, Allied Electronics 512-2570, $7.06.
The BNC plug is Amphenol 69475, Mil clamp, Allied Electronics 713-9828, $7.38.

Allied's order number is (800) 433-5700. Their minimum order is $25.

I am not sure what you are asking for. If it is how to connect via TCP/IP you need an internet connection (ethernet, PPP, SLIP, etc.) and the TGE TCP tool

for the communications toolbox written by Tim Endres (check shareware.com for a copy). Set the MacAPRS communications settings selecting the TGE TCP tool, set host as www.wa4dsy.radio.org on port 14579, select telnet with terminal type of vt100. No TNC or Radio needed.

If you asking about setting up an TCP/IP telnet node, that is a configuration that Dale (WA4DSY) has come up with and is still experimenting with it. I think it runs on a 486 running OS/2. Dale set this up to provide data for

Steve's (KO4HD) JavAPRS project (if i got this wrong, someone please forgive and correct me). Several months ago Dale said that when the technology matured he would release information on how to set up a node and would probably set up a consolidation node (consolidating the input from several nodes into one connection). I have not heard anything since.

Hope this helps,

Bruce

Gee Bob, 90% of my Ohio maps are the 1000 Pt type maps. (seems like they
redraw faster on the 8088 & 286's some people still use for APRS). About
the only updating I'm planning on most of these maps will be adding
symbols to pinpoint specific town centers, airports, etc. If I ever get
into the 20th century and start mapping the new fangle way, I'll let you know.

The offending messages are being return from ISP of
VE3NEC john.langtry@reonet.com see following:

John.. U or UR ISP is causing major problems with the listserver
at TAPR
!!
!!
your messsages are being bounced back and causing some users
to have their mail lost because of it, if you have been following the
list the last couple of day's about killer messages it is your ISP
doing it, its bouncing messages origionated from you back to TAPR
and when these bounced message back and TAPR sends the bounce
info back out to the sig MSIE mail prgram locks Their ISP and their
mail system up and thier mail buffer has to be dumped as a resault.
I have seen these messages in the past about this.......
Is not a problem for me but just thought I would let you know what is
happening and see if you can correct it..
73 de Ron VE3MX, will try and attach or include a copy of
the offending message with this message.....

I had to make adapters for those type of connectors, several times while
on active duty. I finally settled on using a panel mount SMB, soldered
to the cable clamp compression nut, on the BNC connector.

You start by cutting a piece of awg14 solid copper. Trim it and file the
ends to exactly fit both connectors and solder it between the SMB and
the center pin of the BNC. Then solder the connector body to the nut.
Assemble the adaptor with a pair of wrenches. You end up with an adaptor
that is physically robust and does not cause impedance problems.

Make sure APRS is using the same settings as the other comm programs
that _can_ talk to the TNC.

For example, make sure that APRS is set for the correct COM port and,
just as important, that APRS is set for the DTE rate (baud rate) of the
TNC; such as, 4800bps or 9600bps. Most TNC's allow setting of the
DTE rate just after a hard reset.

Has anyone tested it ?
Don't answer :-) I just did and it takes filenames with 0-9 just fine.

The information below was just copied from the message Lee posted, so he
just left them out. Anyway, I think it is a matter of what is disallowed
more than what is allowed.

Since I believe Bob has also uploaded the E and EE files since the change
and they are both there okay, I think we can include 0-9 as a element in a
file name. Anyway, Bob should now have full access to his area on the ftp
site for the APRSdos uploads.

Cheers - Greg

What the heck is going here? I just had the same thing happen with
my IE tonight (20 Nov 96). Lost about 100 messages. Netscape seems to
not be affected. It just happened that this evening I was using IE 301
when it zapped me.

Sure hope somebody can get to the bottom of this.

>
>       Bill
>
>

Ahem.  Yup, but you need to read a little further.  That N is 6.0N stands
for NODE and can only be had by special order.  It is special firmware for a
multi-drop KISS node.  It supports G8BPQ networking.  Since the majority of
these units will be used in FIXED sites, GPS support is not needed.  The N
variant also drops the NEWUSER command and well as on-line help.

Part of reading is comprehension.  With reporting like this, Bill, you could
get a job with any major newspaper.  You have mislead a lot of people by not
getting the full story.

>   "IdleVMWakeUpTime=<seconds>". Setting to zero results in a long wait.
>SeeAlso: INT 15/AX=1000h,

My comments--

Desqview has a similar call DV_PAUSE and it appears to be what is alluded
to above, INT 15/AX=1000h, possibly preceeded by a stack switch,
INT 15/AX=101Ah, and followed by an opposite stack switch INT 15,AX=1025h,
from what I can make of some programming notes in my Desqview appendix J,
p232 of the DV vers 2 manual. (It has been collecting some dust here).

Not sure that I have seen anyone on the SIG allude to running under DV,
but a few years ago some of us were running WA7MBL etc BBS's that
way, and there was an INT14 TSR bios handler for TNC serial ports called
DVIOCOMn.COM that appears to make that kind of a call, from what I can
see with the unassembler just now. Maybe some users still run that way
with some packet apps, and if there is a need that code might be included
too. That driver replaced the COMnBIOS.COM series of drivers that
supported some of those BBS apps comm ports, and was used for this reason
if running under DV instead of plain old dos. I think it became critical
if more than one serial port was being used concurrently.
(That page of notes also has a means to determine if DV is loaded
or not).

This may not exactly be a programming forum, but this is the closest thing I
have seen to any details of how to operate in a timeslicing multitasking
environment yet, of the places I frequent. That topic area in general looks
like it is horribly underdocumented, and it directly affects communications
efficiency for us on packet operating serial ports under timeslicers.
I used to work around some of the industrial control pre-emptive realtime OS,
and these details become critical to getting work done in time.

I would appreciate a URL for Ralf's reference if there is one, or does it
sit on a bookstore shelf somewhere? However, let me say thanks Aaron for the
posting in the first place.

Attn: Bob/WB4APR and Lee/????? & Dan/KE6NYT & Jennifer M....

Ken/W7KKE the Calif Map Coordinator and map maker
extrodinair is out of the country, getting a GPS fix on
the Pyramids and Pharoes in Cairo, Egypt. I wlll
pass your Old Maps message on to him on his return.

Lee the latest updated/maps are in MAPLIST06.ZIP posted
at TAPR APRS , if specific maps have spelling error, why not
advise Ken and he will correct same. Your message will
be passed to him also. He also sends message notices of
newest maplist releases both here on sig and on Packet
BBS msgs.. They can be downloaded locally LL BBS's also.

```
  Dan/KE6NYT,  for your  Ventura county  special maps, ask Ken to help
you out, he has always been very accomodating for specific
area maps down to .5mile from any he has on his CD-ROM Disk
from C&GD survey. Ck with him for LAX area special or better
maps also.

  Jennifer MacLean.. For your Victoria, BC maps, contact
ddobbins@juno.com
or perhaps Ken/W7KKE  can help you for special or APRS maps, for your
area..

> spelling errors on the bay area maps.

APRSdos REPLY/COMMENT:  What Calif maps?  What spelling errors?  Can you
be a little more specific?  I ship out a standard distro of Wmaps10.zip
which includes all of my original large calif maps.  There is a separate
local distribution of CAmaps##.zip put out by the CA map coordinator,
W7KKE in Foster CIty. I have nothing to do with them unless he tells me to
make changes to my larger maps.

If there are spelling errors in my maps, then list them.  I can't go
searching every map looking for something that I dont know is misspelled!

You can run java aprs (or at least have access to the java aprs sites with
OS/2 Warp 4, using Netscape for OS/2 which is available in beta from IBM.
I have used it myself and it works very nicely, but it is certainly beta.
The beta is going to be upgraded before the end of the month for you OS/2
people out there. 73,

>Did I miss something on the  instruction side or is the ProtoPath list in
>v1.1.7 of WinAPRS not working?
>

I messed up and the released version of 1.1.7 did not have all of the
debugging code removed, therefore the Unproto path display does not work
correctly.

SInce the release of 1.1.7 I have fixed the following

       Can now read dosAPRS .HST files.
       UnprotoPath window bug fixed
       Finished CAP Search and Resqueue grids, now displays labels

My normal policiy is not to release more than once a month unless its real
important (like the HSP stuff).
```

I have been very busy working on lots of aspects. I am putting a lot of
work into the areas that had the most requests. I hope to have the
multiple path list capability working in a month or so.

Mark

I always list the bug fixes / improvments in the "Recent Additions to
WinAPRS/MacAPRS section of the docs on

http://aprs.rutgers.edu/aprs/

With this last release, we will be trying to always make releases of Mac
and WIndows at the same time. We are now to the point were all
improvements normally affect both platforms. THere are still some specific
Windows only issues but they are getting smaller.

559. Latest pcMAPS

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 20 Nov 1996 11:42:39 -0500 (EST)

To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.961120113359.16303B-100000@arctic>
Rendered body type: text/plain

I just scanned through all the maps in the files/maps/PCMaps area and asked for about 60% of the old files to be deleted. Hopefully here is what remains as the latest of each version:

almaps07.zip
akmaps01.zip
bamaps96.zip
camaps06.zip
eumaps02.zip
flmaps02.zip
gamaps02.zip
limaps.zip
ilmaps2a.zip
inmaps04.zip
HIMAPS10.zip
mamaps03.zip
mdmaps06.zip
mimaps01.zip
msmaps03.zip
nemaps01.zip
ohmaps07.zip
onmaps31.zip
pamaps04.zip
samaps02.zip
TNMAPS04.ZIP
txmaps01.zip
ukmaps02.zip
vamap08.zip

ARGH, I forgot to check the uploads area. I will do that next, and then re-issue this message with it updated to the latest in uploads area...

No it wouldnt, then you would see what was below. You can turn off Icons and just get small dots.

```
I have never seen "transparent ICONs", so I do not even know if it can be done.

563. KILLER mail

From: rkramer@merge1.mergetel.com (Ronald Kramer)
Date: Wed, 20 Nov 1996 18:37:04 GMT
To: aprssig@tapr.org
Message-ID: <329e4f88.1214721@mail.mergetel.com>
Rendered body type: text/plain

```
Hi Sig..
here is info I sent John VE3NEC about the mailer

Hi John
just playing around and here is what I found
if I initiat a private email for you as in new email
without refering to the aprssig, it keeps the john.langtry
in lower case, but if I take a message from the sig and
reply but remove the aprssig.tapr.org from the to field
and replace it with john.langtry@resonet.com, when
the mailer sends it out it changes the lower case to
upper case in your name only.
When the aprssig receives mail from you, your address
shows in upper case JOHN.LANGTRY@resonet.com.
possibly it is their list server that does not like the
period in your name but not shure....
```

```
anyway this is just to inform you what I found.

73 de Ron                                     Best Regard

Message-ID: <v03007800aeb8ceb58c3b@[138.87.2.109]>
Rendered body type: text/plain

```
DOS versions of APRS are in: /tapr/SIG/aprssig/files/dosstuff/APRSdos/

now.  Sorry if you are inconvenienced for renaming your links.

The other areas are not changed.  That is:
Macintosh APRS - /tapr/SIG/aprssig/files/macstuff
Windows APRS   - /tapr/SIG/aprssig/files/winstuff
Garmin stuff   - /tapr/SIG/aprssig/files/garmin
etc.

You should look in those directories for the appropriate files.  The upload
directory will be just for that purpose.  The latest version uploaded will
be there.   If it is real fresh, you will find it in the upload directory.

Files without a <filename>.TXT will most certainly be gone the next time
you look.  For details about that reasoning, look at the header of the file
list.

I will be the one that will move the files to the related APRS area.  If
you have to, tell me how it is APRS related to give me an idea on where to
put it.  Give me a day or so to answer your e-mail.

Thank you for your time.

From: "Larry P. Thomas WA0GWA" <lpthomas@winning-edge.com>
Subject: Delorme Tripmaker GPS $125 vs $179

Delorme sent out the offer to people in their database of know purchasers.
I've bought Map Expert and both versions of Map'N'Go in the past so I think
they are offering it discounted to previous buyer.  The offer does, however,
allow one to specify how many they wish to buy at the $125 price.  I'm sure
there is some limit and more than two or so would most likely generate
questions from Delorme as to entended use (like resale).

Concerning the use of software with only with the supplied tripmate, I don't
think that is accurate but I could be wrong.  The verdict is also still out
as to if the Tripmate can be used in any other NMEA driven software with
slight modification.

I cut the following from a post to a news group.  I don't generally follow
them and I thought other in this SIG might not either so here it is for what
it's worth.  It sounds to me as if the Tripmate might be very usable in aprs
with little modification.  The Init String required could be sent out before
running the aprs software if needed.  I don't know Bob's background but he
sounds like he knows what he is talking about.
-----------------------------------------------------------------------
From:       Bob Martin <martin@inmind.com>
Newsgroups: sci.geo.satellite-nav
Subject:    Delorme Tripmate GPS for SA 4.0
Date:       Wed, 20 Nov 1996 08:46:07 -0500

Bob Martin again....

   The basic Tripmate seems to be a Rockwell 12 channel setup
assembled by Trimble for DeLorme.

   Haven't BEEN to Europe lately, but I don't see why the
hardware won't work fine there.

   A simple NMEA message is sent to it to insert it's current
location, time, and startup data, after that it is no more or
less than a good NMEA module.  To keep the costs down, it
doesn't have non-volatile memory for certain things, and needs
to be spoon fed to upstart.

   DeLorme software does that without a lot of noise. SA4 is
great... If I had source in hand, I would change two teeeeny
details, but I am pretty pleased with it right now.

   Yes, it's ugly yellow, just put a bag over it's head.

   The battery life isn't all that bad.  It wouldn't take a
rocket scientist to power it from 12v.  My 7.5v Nicad pack
works great too.

   To buy anything that works better than SA4 and Tripmate, you
would have to spend a helluva lot of money....

   Bob

If you're developing your icons with PaintBrush there IS a way to make the background "transparent". I'm not sure how to accomplish it, but it's a matter of turning some type of attribute for the bmp/gif file on/off...

Hi from Dallas:
  Just in the 3 weeks that I've been on APRS (and monitoring this sig),
I've seen activity in Texas picking up. We regularly see down to Houston
and San Antonio via VHF with a couple well placed WIDEs.
  Here's an easy question I'm sure, but one that I have searched for in
the docs to no avail. On my USA.mp, there is a line that runs up
CA, OR and WA, across Idaho down the midwest to just east of Dallas,
etc. on across the country.  I know it is for something but I sure can't
figure out what. Two part question-- what is it for, and how can I
toggle it off?
  Enjoying the sig and learning a lot...

> http://www.startext.net/homes/rcasey | Think globally, connect locally

That line, if it's the one I'm thinking of, was the route of the Olympic
Torch caravan.  I believe 75c was the only version that had it shown on
the USA map.  Later (and earlier) versions of the program have a
different USA map that does not include the Torch Route.  Running a
newer version was the easiest way for me to eliminate it.  It was kinda
handy during the event as it came right through here!

Welcome to APRS in DFW!  Activity has really expanded around here in the
last few months but it's still not like it is in the NorthEast and other
places.  I guess we're just a little slow to jump on new ideas!  In
addition to the Wides, there is at least one Gate operating in Fort Worth
that you should see (if I can keep it on the air!!!) and a handful of
trackers that drive around for your viewing pleasure.

Keep in touch and Have FUN!

To: aprssig@tapr.org
Message-ID: <199611210300.TAA04749@dfw-ix12.ix.netcom.com>
Rendered body type: text/plain

One more time please!

I lost my GPS to computer cable, and lost the pinout to make another one!

I have the power hooked up, but not the data, on my new G45 cable.

The brown, serial data out, wire goes to which pin of the female DB9 connector?

The white, serial data in, wire goes to which pin of the female DB9 connector?

The black, ground wire which also is negative or ground on the 12 volt power line, goes to which pin of the female DB9 connector?

Please respond directly to SmithAL@ix.netcom.com

586. Delorme Tripmate additional information.

From: "Eric A. Cottrell" <eac@shore.net>
Date: Wed, 20 Nov 1996 23:15:36 -0400
To: amsat-bb@amsat.org, aprssig@tapr.org
Message-ID: <848549736-0-eac@shore.net>
Rendered body type: text/plain

Hello,

I received information on several sources that the Delorme Tripmate has proprietary firmware and there has been questions about the output of the Tripmate receiver.

At the present time the receiver can be used with Street Atlas 4.0 and Map'n'Go Version 2.0. It is also possible to use a terminal program and log the raw NMEA sentences to the Disk after sending the $IIGPQ,ASTRAL<cr><lf> string to the receiver.   If a NMEA display/logging program cannot sent the $IIGPQ string then it cannot be used. The bright side is that at least one person is working on a Display program using Basic that can use the receiver. It appears the only proprietary part is the need for sending the $IIGPQ string after powerup. All other output appears to be NMEA.

I found that the receiver will accept NMEA commands with or without checksums.

I got a interesting message from James Miller who has the "Jupiter" board. He mentions some strings to control the NMEA output messages and they work with a tripmate. Here is a few examples:

```
$PRWIILOG,RMC,V,,,<cr><lf>    Turn off GPRMC messages.
$PRWIILOG,RMC,A,,,<cr><lf>    Turn on GPRMC messages.
$PRWIILOG,RMC,A,T,10,0<cr><lf>    Turn on GPRMC messages
                                                       and output
every ten seconds.
```

I would only use the on and off commands as the receiver will remember

the settings if you change it and cycle the power. I found I can control
the messages GSV, ZCH, RMC, GGA and GSA (Just subsitute for RMC
in the above example) . This command will not force output if the
message is no valid (GSV with no almanac data). It just controls
how often the message is outputted when valid.

Also He gets a message on powerup of

$PRWIRID,12,01.03,04/04/96,0003

Which indicates: 12 = number of channels
01.03 = Version Number
04/04/96 = Version Date
0003 - Option List

My unit gives a string of:
$PRWIRID,12,01.05,07/29/96,0003

which at least indicates the same options list and later firmware.

Hopefully I will get the documentation from Rockwell soon and I can
try out some more commands on the receiver. Maybe with the pinout
I can figure out if 1 PPS and the second serial port can be used.

I agree - they (the Sprouls) & Bob are doing a great job for the ham
community.

We, in Orange County California would like to extend an invitation to the
Sprouls and Bob
for dinner with our group anytime they are in our area.

We too have a "few" professional programers and avid tech type builders out
here too.

I have enclosed a few url's for your review.

Message-ID: <19961120.212432.4455.5.ddobbins@juno.com>
Rendered body type: text/plain

Don't forget when updating DOS APRS to unzip using the -d or -dn option.
I think the error code referred was caused by having all the maplists,
maps, other files in one common directory, not in their normal sub
directories.

Hope this helps.

1200 baud AFSK packet uses 1200 and 2200 HZ

9600 baud DFM (called FSK by some) uses a 4800 Hz center frequency and
'FMs' this between about 10 Hz and 9600 Hz. There are not any mark and
space tones (and that is why I counted the Direct FM - DFM) term back in
1988 so people wouldn't ask what the mark and space tones are, HI!)

An aside to the SIG: I have upgraded my MS Exchange with Service Pack 2. Do

Now that I have direct access, I will be posting all of my new APRS stuff
directly into the following directory WITHOUT posting it first in UPLOAD.

So look for my original APRS distribution files in:

   tapr/SIG/aprssig/files/dosstuff/APRSdos

Notice that the last directory name changed from DOSaprs to APRSdos, so
change your links accordingly...

APRSdos REPLY/COMMENT: That is DEVICE NOT AVAILBLE. IE, your COMM port!
It is a MICROSOFT bullet. Whatever they do when they boot to windows
makes your COMM port disappear to QBasic! And they wrote QBasic!

You can prove that it is their fault. SImply write the following one line
QBasic program: OPEN "COM1:9600,n,8,1" as #1

and you will get the error!

The only way around it is to boot directly to DOS. Dont let Windows
run...

I think this topic was discussed about a year ago. It seems to me that HID should be on to provide the proper/legal identification of a station. If your position and beacon have decayed to more than 10 minutes and your station is being used to digipeat as one of the generic aliases (Relay - Wide), then your station might not transmit proper identification without HID ON. When you digipeat as a "relay" or "wide" your callsign is not transmitted as part of that digipeated packet.

Sounds like if there are enough of these GPS units out there, that it would be easy to add the INIT string to APRS.

Do I send it once, or everytime I need a new NMEA posit?

Yes, but in the time we used to respond to this you coulda just as easily
used a search engine.

www.kantronics.com (go figure)

And BTW, the Firmware version 6.0N mentioned is a special order item for
node ops. Kantronics continues support for GPS in ALL of their standard TNC's.

I dont think this would apply as it would be the same as a voice
repeater and they only are required to be identified when in use,
you don't hear voice repeater's identify every 10 minutes if they are
not in use.

I'm looking for a low price (Around $150 to $250) that has a data port so I
can hook it to my KPC-3 to do APRS. I've looked at a few around $140 to $200
and they lack the data port. Any one have some Ideas??

                                          tnx,
                                         Jamie - KE4HTM

HID only identifies following a digipeated transmission, just as a
repeater. It is needed unless you have a beacon, containing your call,
that is sent every 10 minutes. Annoying, yes, but needed for legality.

Bob, and all,

bamaps96.zip is really maps for the 1996 BAA Boston Marathon, which are
more detailed for the Marathon course than the mamaps03.zip. They were
generated by W1KRU for this years event. I uploaded them before the standard
of sending a text file with it was implemented. They aren't baja maps at all.

Not a problem with the KPC-3, I think, as it can send a GPSINIT string.

Can anyone else confirm that? I'd have to dig up my supplemental manual.

WRONG! WRONG! WRONG! (at least in the cases we are trying to discuss)

Not to beat a dead horse, but please READ, COMPREHEND!
```

The problem some of us are having has ABSOLUTELY NOTHING
to do with our mailer software. The ISP (internet service
provider) software is STRIPPING the headers, so there is
no way to find out who the originator is. We have no
control over this, other than screaming at our ISP, which
several of us are doing. In the mean time is it too much
to ask that people place their email address in the body/
signature of their messages?

Because if it is, then a lot of mail that could reply
privately will continue to go to the sig. Not because the
people are incompetent or their software doesn't work right,
but simply because the ISP's software is stripping the
headers. I am told there are several ISP software packages
that are KNOWN to do this. At least my ISP is committed to
changing software, but it's going to be weeks if not months,
and other providers may not choose to worry about it.

End of Thread (we can only hope)

aprssig@tapr.org said:

>I have no problem finding private return address.

You would if your ISP was STRIPPING THEM...and that is
exactly what some of us are having trouble with. The
software is working perfectly (I am using OS/2), but
my ISP is killing the darn headers. He knows it and is
going to upgrade his ISP software...but not for a few
months. Not all ISP's will be so responsive, so again,
I PLEAD, please put your email address in the body/
signature of your message to allow us to reply privately.

KE4HTM-----------------------------------------------------------------------
West Marine is selling the Garmin GPS 38 for $149.95.  It is supposed to
be the Garmin 45 with a patch antenna built in, no BNC antenna connector,
but it does have a NEMA Data port.  The power requirements are not as
flexible as the 45, but they do sell a 12 volt power cable seperately.
1-800-538-0775.
There should be a way to break into the case and put an antenna
connection on the circuit board to add your own BNC.  Anyone tried this
yet?  We Ham's think nothing of performing microsurgery on a $500 Dual
Band Handheld to expand coverage, but shy away from this.  So, you lose
the nitrogen charge that makes it waterproof, but you're gonna keep it
inside where you can see it anyway, aren't you???

Just a thought, I already have a Garmin 45...

I think the HID needs to be on.  APRS cannot tell what the devil the
TNC is doing ( as far as it being used as a digipeater. ) so the fact
that some one digis throught the Station requires the Transmitter to
ID since it was on the air.  APRS will degrade into Beaconing very
little even thought someone is digi'ing through the station.

I would keep HID on.

Thanks to the help from this SIG I can now add roads to existing maps using
Edit and New commands. I have a map now however that is giving me a problem.
It is surrounded in a large yellow square with a small yellow circle in the
upper left hand corner of the square. There is a green point in this circle.
When I add a new road using Edit, New, enter name and color, Edit, Add and
then Save, the road turns gray and a gray line shoots up to the circle in
the corner. The road turns gray no matter what color I use for the road.
How do I delete the little yellow circle and green point in the corner? Any
help would be greatly appreciated. 73, Jud

A common misconception. There is no nitrogen charge. The final assy step is
to put it in a chamber, evacuate the air and replace it with nitrogen. It is
then removed from the chamber and a screw is sealed into the case. This
procedure is called Marketing.

Amen-

Dear Abby-
Currently in the South here, we continue to see a bulletin of about 8-10 lines telling about someone's web page. It even has cute little graphics and blank lines for spacing and everything!

We all knew about the web page the first time he sent it, but how do we let him know we are now duly informed without making him think we are whining. We aren't ...we just want him to observe better operating habits in our busy network. I doubt he sees our stations because we don't path out that far. His path is WIDE,WIDE,WIDE or sometimes even 4 of them!

Seems like almost everyone has an APRS web page now, and we appreciate them- but be don't need to be reminded dozens of times a day.

Signed

I purchaced a Garmin GPS 40 for $209 from EEB. I am completely satisfied with the unit. It not only has a data out port but also an external antenna port. The antenna port is a MCX connector. You can putchace a Garmin external antenna with 6' of cable for $105 from EEB. For thes few extra dollars I would HIGHLY recommend purchacing the 40 and not the 38!

EEB
323 Mill St.

What I quoted in the origonal msg was only part of the bulletin line
the first part was   "76to77e.zip upgrd at ......"

I consider this a useful bulletin, if it was just notifying people of
my web page then I would not have put it out at all, it tells the
LOCAL users only, since I did not put it through a GATE, that a new
version of APRSDOS was out and where to obtain it.....

>special projects designed aroung this particular unit?

I use two GPS-20's (TAPR group purchanse) with Trimble antennas from Paccomm
associated with two MIM 1.06's from Clement Engineering for standalone
trackers.  They work great... just as advertised... I plan to get more MIM's
for some telemetry work.  TAPR is about to offer MIC-E (MIM derivatives)
which fit perfectly with a GPS-20.

The GPS-20 is an engine only... no case, no display, no keyboard, no battery
compartment... comes with just a small coax pigtail with an MCX connector
and a small (really small!) power/data connector for I/O.  Treat them with TLC.

Check the docs with the DOS version for details of operation. The equipment
works. Also, Tom Clark, W3IWI, will be introducing his Totally Accurate
Clock project via TAPR which uses a GPS-20.  Nifty stuff!

 Have fun es 73 de Boyd

Well confused in Georgia, before I quit running APRS i seen many from Georgia
trying get lot's of people to get in on buying APRS day in and day out, what's
the difference. I also have a question for Dear Abby, why don't they just
BUDLIST the person since that seems to be the norm their.

Interesting article in "Science" magazine for Nov. 1'96, by Noam (Columbia University) and Sato (Konan University of Kobe, Japan), title is "Kobe's Lesson: Dial 711 for Open Emergency Communications".

They did analysis of emergency comms after Kobe, Mexico City (1985), San Francisco (1989) and Northridge (1994) earthquakes. Some bottom lines:

*landline and wireless telephone all go into instant saturation and stay that way for days. Pay phones stuffed with coins, also useless.
*Incoming (attempted) traffic by far greater than outgoing.
*Television provided nothing that anyone needed to know.
*People turned to talk radio (gasp!) for meaningful info via their BC band portables
*Too many batteries are barely enough
*Computer networks and BBS's were by far the most efficient means of passing vital comms
*Most interesting point was the appearance of "information volunteers" showing up with laptops
*They got "out and about", found out real needs, posted meaningful info about food, supplies, etc. and put this info on a regional MAP.
*Gov't agencies were clueless, like everyone else early in the disasters.
*Kobe had just installed $80M satcomm system. It got two messages out before it failed.

Authors are recommending a decentralization of emergency information systems, with open access and horizontal communications. "Information volunteers" would log in information, "possibily into a schematic block-by-block display of a city". This would somehow be accessed by dialing 711. (this part not too clear). Amateur radio was not mentioned, but this has APRS written all over it.

>From reading the thread on this GPS, it sounds like it may well be useful for APRS applications. Since this $125 offer seems to have been made only to previous Delorme customers, and general interest seems rather high, has anyone recieved the offer that is NOT interested in aquiring the GPS? Maybe they would be interested in passing on the offer to others? I am currently looking for the best deal on a GPS module to dedicate to my mobile tracker package and free up my Garmin GPS 90 for other uses. I don't like leaving this unit laying around baking in my car anyway.

if you're interested in a dedicated gps receiver for aprs tracking, might i suggest the GPS-20 from TAPR. it's a gps card without display. i used it with my kpc-3 and radio shack ht for a standalone tracker with never a problem. all it needs is a 5vdc power source and an antenna and it starts spitting out gps data. i like it cause i can have the whole tracker come on and off with a switch, as opposed to using my garmin 45 handheld where i have to hold a power switch for a few seconds to get it to come on and off. the gps card powers up automatically with power and starts acquiring satellites rapidly. only other connections are data out and ground. no initialization strings need to be sent to the receiver. i think i paid about $165.00.
anyways, hope this info helps you out.

> How do I delete the little yellow circle and green point in the corner? Any

APRSdos REPLY/COMMENT: You have a map point with an X value of 0....
Three techniques to try:

1 Try the TASKS-CLEAR which tries to clear out single points. Try using the command a couple of times.

2. Save the file and re-load it.

3. Try to determine where the point is in the whole file. Use the +/- and Next Prevoius keys to help.... Once you have found it, (or the one before or after it), note its exact coordinates as shown in the lower left corner of the screen.... Save the file, then use EDIT or whatever editor you like to search for the point.. Clean up the file manually and then re-save it.

The whole idea is that 0,0 is used to separate features in the file.
C,name is used to describe the feature and its color C.   BUT when this file is loaded into APRS, the NAME is dropped and the 0,0 becomes 0,C where C is the color. So you see, that ANY point that starts with a 0, will begin a new feature.   APRS gets confused if it sees two 0,C's together or with only one point between them,,,

Message-ID: <Pine.GSO.3.95.961122095703.14340A-100000@arctic>
Rendered body type: text/plain

```
Here is a summary of WB4APR's standard distribution files.  THese are
posted in tapr/SIG/aprssig/files/dosstuff/APRSdos

aprs77e.zip
76to77e.zip
emaps13.zip East coast maps    * In all of these map files, there has
mmaps07.zip Midwest maps       * been little added in the last versions
cmaps12.zip Central usa        * Maybe just 1 new map or so...
wmaps11.zip West coast         *
neamaps1.zip New England maps  * So you may not need to get the latest
semaps12.zip South East maps   *
mdmaps06.zip Maryland Cpk Bay area

APRS disks are distributed with the overall program zip file (about 1
Meg) and one of the given MAP files depending on your area (about 350K).
All of these files should be unzipped with PKUNZIP -D.  All other mapfiles
that you see were made by the other state map coordinators and will be
found in the:

tapr/SIG/aprssig/files/maps/PCMaps directory...

Yes, there is a Java enabled Netscape Navagator for Linux.
You can get it from the Netscape download site where all
17 other versions are.  (I don't have the url handy).  The beta
I downloaded worked but had a few bugs.  I no longer have
a working Linux installed so I don't know if it has been improved.

To: aprssig@tapr.org

Hi from Dallas:
  Just in the 3 weeks that I've been on APRS (and monitoring this sig),
I've seen activity in Texas picking up. We regularly see down to Houston
and San Antonio via VHF with a couple well placed WIDEs.
  Here's an easy question I'm sure, but one that I have searched for in
the docs to no avail. On my USA.mp, there is a line that runs up
CA, OR and WA, across Idaho down the midwest to just east of Dallas,
etc. on across the country.  I know it is for something but I sure can't
figure out what. Two part question-- what is it for, and how can I
toggle it off?
  Enjoying the sig and learning a lot...
   73, Rich/n5csu

Thanks Mike.

I'm interested in the dedicated GPS for both APRS and moving map
applications. The Tripmate supposidly has a 12 channel reciever and is
sealed in a weather resistant rubber case. The following are several things
I have learned about the Delorme package..

Street Atlas 4.0 does work with the NMEA output from the Garmin GPS's and
will run under WINDOWS 3.1.

The Tripmate GPS requires an initial INIT string to turn it on and tell it
where it is. It will then output data continiusly. This INIT string can be
sent to it using a basic comm program, so APRS should be able to handle this
task easily. How about the MIM module?

Delorme wants $149.00 + $5.00 Shipping.
My local computer store wants $179.00 + 5% tax
I want one this weekend for a 1500 mile trip on Monday.

Oh well, I guess it won't happen this weekend :)

Hey All,
The GPS I have been using is the Garmin GPS 38

UNIT COST: LAST AT WALMART $200
LAST AT WEST MARINE IN DALLAS $149.99 ADVERRTISED
It has:
DATA in/out
Built in ANT.
4 AA Battery supply
Accepts 5~8 VDC in through data port
Outputs 4800 BPS data
INPUTS 4800 BPS data

I use this in combination with a KPC-3 and a KNWD TM-241A and a ICOM HT
works very well and uestions email me

THe GARMIN GPS 40 is SAME but with EXTERNAL ANT JACK

(This message is from Keith Sproul, WU2Z)

Jimmie, KB5WIO, was at my fathers house today (I am in Texas) and brought
his new Delorme Tripmate with him.

We hooked this up to WinAPRS and it worked GREAT!!!

We will be adding a few features to WinAPRS to make it send the appropriate
initialization strings out to make it easier for the user.

I was quite impressed with this unit, and plan on ordering one for myself
shortly.

Keith Sproul, WU2Z (In Texas on Vacation)

Hello,

If you have a Microcenter around they have it for $150.

The receiver will work if you just send the $IIGPQ part, but setting the inital Lat/Lon and time makes it faster.

Hi All,

On Wed, 20 Nov 1996 Jim Conrad noted that DeLorme is:

>... being selective on who gets the offer because I've also
>purchased a number of their products ... and have not receiv-
>ed any offers.

Me neither, and I've been buying their products for over a decade. If you're into GREAT printed maps, take a look at some of the large ones they've produced over the years.

Nonetheless, I feel slighted! 73

Hello,

The $IIGPQ,ASTRAL<cr/lf> string only needs to be sent when the GPS receiver is outputing the ASTRAL string on powerup.

You may have to power the GPS up first then reset the TNC as it takes about 4 or 5 seconds for the GPS receiver to come up.

          I ordered Tripmaker yesterday. I had not registered my ver
2.0 of Streets USA and had not recieved a mail offer. They requested
the serial number (in the clear protion) from my CD and sold me the
Tripmaker package for $125 + $5. shipping.
Hmm...I may order another copy of the CD for the office, or home
 or my freind that needs one too.

659. BUDLIST on KE4JJU-3 & WA4SSP-14

From: w4wwq@juno.com (Peter J Lascell)
Date: Sat, 23 Nov 1996 11:30:41 EST
To: aprssig@tapr.org
Message-ID: <19961123.112816.4543.0.W4WWQ@juno.com>
Rendered body type: text/plain

```
I have mentioned this problem before here on the SIG but get no
responses.  I can't imagine I am the only station having the problem.

To band aid it I have used the LCALL and BUDLIST commands in the TNC to
ignore KE4JJU-3 and WA4SSP-14.

The problem KE4JJU-3 causes on my display is that it will stop processing
APRS and a wide horizontal RED band appears with ERROR 6.  Yes, pressing
the ENTER button will get it going again but everything is lost from the
time the lockup happened.  KE4JJU-3 is a WX station and I think the WX
data is the thing that crashes me.

 After rejecting all packets from KE4JJU-3, then the following started
showing up.

WA4SSP-14 is sending zillions of position reports that contain nothing
but time and commas.  They come so fast, it pushes the map off the top of
the screen displays the packet message down the left side of the display.

I don't know either of these station/operators and I feel sure they are
not doing anything to intentionally cause me problems.  It is very
possible besides the logic ONE and ZERO there are some MAYBEs out there.
But am I the only one seeing these problems?

Have I reached the limit on processing time that my old computer can't
keep up?

I run APRS 7.7C on a 286-12 MHz clone with math co-processor, and MFJ
1270 TNC.

With the BUDLIST feature active for these two calls the two  problems are
not re-occurring in a 48 hour period.  Before it was guaranteed to happen
over night, if it didn't happen in front of my nose while watching the
screen.

Any ideas guys?

Hello,

I got some information on the Jupiter board. I looked inside the unit and it looks like a custom board that uses some of the same components as the Jupiter board.

I have not had a chance to check it out but it appears that the unit will NOT work off of 12 or 13.6 volts. The Maxium chip used has a limit of 11 volts and the cap on the DC input appears to have a 10 volt rating. So to be safe feed it with 6 volts.

In a few weeks in will be installing an APRS system in my car to beacon my
location.  I looked at some local mobile APRS stations and noticed that
their ID always had a dash 9, for example, W5ABC-9.  Is the -9 common
practice?  I know you can use almost any number, but is the "-9" a standard?

I have a home station that I ID as                --> W9IF
and depending on above reponse, my mobile will be --> W9IF-9

Does that make sense?

TIA

Check in the "read-me" files.  The "-9" is decoded as the cute little red
car and "-15' is decoded as a blue van.  Somewhere in the "read-me" files
is a list of the ssid object codes.

Yes, it makes perfect sense.  The early mobile packet operators used the -9
SSID and I think that has probably held true in the carry-over to APRS.

Also, the -9 SSID when used as the SSID of a stand-alone tracker will
default to the AUTOMOBILE ICON.  If you read the SYMBOLS.TXT file you will
find a complete listing of the various SSID standards....

Hello,

The two commands that should be added are a GPS init string and a GPS init
delay.
The delay is needed to make sure the receiver is up and running before the
init
is sent. It should be possible to enter a cr/lf combination to handle
NMEA strings.

I think at least one person at Delorme knows as I was posting my
information to
sci.geo.satellite-nav. I did send him a message with comments as to what I
liked and disliked about the tripmate. I also briefly explained some of
the radio
amateur uses such as timekeeping, where hams involved in Public Service
and Emergencies are located and that the Tripmate looked like a good unit
to use.

If anyone raises the ire of Delorme then it will be me. I figured if I
did not do it then
someone else would. I rather figure it out for my own use instead of
waiting.

There are restrictions in the Street Atlas 4.0 manual that cover the
software.
Delorme has some interesting restrictions on their software. No such
restrictions

exist for the tripmate GPS receiver. None were in the Tripmate manual. I also do not
consider the tripmate GPS receiver to be software. It is a device, like a computer.

I suppose that looking at the communications with an analyzer could be considered reverse engineering. This has been done with the Garmin 45 and details are freely discussed and posted on the newsgroup and web sites. However I believe IBM tried to sue companies who duplicated LU communication units by looking at the protocol and IBM was not sucessful. If they were I bet Microsoft could not put Netware protocols into Windows 95.
All the non-Garmin programs talking garmin protocol would also be in trouble.
In fact I wonder if Delorme got permission to use Garmin protocols in their products?

I suppose if Delorme really wanted to keep it secret they could have implemented
their own protocol instead of using other companies (NMEA and Rockwell).
I may be wrong, but I consider protocols fair game.

Rendered body type: text/plain

The weekly Sunday Night APRS Net in Kansas City meets at 8:00 p.m. CST on 146.79 MHz (-600 offset). We welcome check-ins by both voice and through the APRS network.

To check in via APRS send a one-liner to KU0G-1. I'm on both HF and VHF during the net and working both voice and data. For your QNI, simply put your name and city/state in the message and I'll acknowledge you on the VHF net on voice. Your **ACK** from the APRS station will be your confirmation that you're checked in. I will also post a periodic QNI Log as a Bulletin during and immediately following the net.

Come join us!!!

73 de Jim, KU0G
Chairman/Coordinator

Kansas City APRS Working Group

Hi Bill.  I don't know whether javAPRS will run with Windows 3.11 and
Win32s or not.  Probably not, I would geuss.  I do know that Win32s is
required to be installed in Windows 3.11 for it to be able to run
WinAPRS.  Win32s is what it takes for Windows 3.11 to act enough like a
32 bit operating system for WinAPRS to run.  I would recommend
installing Win32s in your Windows 3.11 and see what happens.  At least
you'll be able to try WinAPRS (although the WinAPRS program runs alot
better in Windows 95, icons are sized right, lines display properly,
etc.).  Maybe it's time for you to upgrade to Windows 95!  I have, and I
really like it.  I wouldn't want to go back to Windows 3.11.  Windows 95
is much more stable (doesn't crash as often) and is much better at
multitasking (running more than one program at a time).  If you do
decide to try Windows 95, then check this URL before you buy Windows 95:
http://www.microsoft.com/windows/support/supptools.htm
It has a file that you run in Windows 3.11 to tell you if your computer
is ready for Windows 95 or not.  Have fun!  See you on APRS!  73.  Cap

        I often have the same problem. My screen fills with lines
from Johns ssp-14 mobile. This only happens occasionally but when it
does data processing stops until I hit enter. Somehow his tnc must be
sending every  sentence from his gps reciever, every second. I had
recieved email from John but return mail was undeliverable. I shure
enjoy his WX station and watching his mobile....well most of the time
he he.

Rendered body type: text/plain

```
I am excited to see weather info displayed from a remote U2000 using
WinAPRS.  My question is the wind disply when looking at the station.  It
apears to be missing a decimal.  I don't think winds are 54mph this
morning, but I have not really ventured out yet.

I am using the latest version found on the TAPR FTP site.  I can send the
actual data string from the remote U2000 if needed.

Thanks

KD4GOE

Rendered body type: text/plain

```
Hello All:
I'm looking for info/help with making connections with GPS and TNC. I
have a Magellan 3000 with Power/Data module and KPC-3 with v 6.0
firmware. The info that came with the P/D module lists ,
Red  = V+
Black  = GND
Yellow = Data Send
Orange = Data Rcv.
```

The KPC-3 Cabling to GPS,
* connect signal ground of GPS data port to pin 7 of KPC-3 serial port.
This wire may be identified as "NMEA-" by some GPS Vendors.
* connect the "data output pin" of the GPS data port to pin 2 of KPC-3
serial port.The data output pin may be identified as "NMEA+" by some GPS
Vendors.
* KPC-3 serial port provide for signals that swing PLUS and MINUS
approximately 8 volts. Check GPS manual before connecting this wire to
make sure that the GPS is capable of handling these voltages.

The GPS info is unclear as what connect are to be made.

I'm wondering if anyone is using this equipment and can help me with
this.

Thank You
Phil Greenland , KB8QHM

681. MIM Module Problems??

From: AC6JA@aol.com
Date: Sun, 24 Nov 1996 18:12:12 -0500
To: aprssig@tapr.org
Message-ID: <961124181211_1117621284@emout14.mail.aol.com>
Rendered body type: text/plain

finally hooked up my MIM module to the GPS-20 gps card but am now having
problems. gps card now doesn't seem to want to lock on to any satellites. i
am using the trimble mag mount antenna. when i use my garmin 45 with trimble
antenna and data out hooked up to MIM module, everything works fine. the
biggest problem seems to be if i enable the beacon for my beacon text and i
don't have a lock on any satellites, my beacon goes from once every 20
minutes to once every THREE seconds. problem goes away when there is valid
gps data on pin 20, like when i hook up the garmin 45. had been using the
gps-20 for quite some time in the truck with no problems. i am using a 7805
regulator for the 5v supply to the gps-20 and under load puts out 4.97vdc.
am powering the MIM module with 12v to pin 1.
also had a problem with the MIM module losing its stored data just by turning
the power off and on. seems like it's doing a reset after so many powerups?
any info from anyone who's gotten the abovementioned items working would be
GREATLY appreciated!
thanks!

Mike AC6JA

Sounds like he may have a KPC-3 tracker with CMSG not set to DISC.
If someone connects to a unit in this configuration, it will stream until
the entire GPS track buffer has been sent over the channel.

always set CMSG to DISC on a KPC3 if you don't wanna make everyone go
crazy. Just ask Bob Winingham (hehe)

Rendered body type: text/plain

For weeks now, I have been trying to send messages to a local WinAPRS
station, but he never acks. He says he is getting my messages. But I
never see any acks although I do see his STATUS and POSITION packets. He
just upgraded a week or so ago, he said to fix the problem, but it is
still there... His position includes the string -117-<520> which I guess
is the WinAPRS version number.

I wont bother the Sprouls with this but has anoyone else had a simplar
experience..?

687. SEATTLE APRS INFO

From: ddobbins@juno.com (David S Dobbins)
Date: Sat, 23 Nov 1996 18:25:17 PST
To: aprssig@tapr.org
Message-ID: <19961123.185945.4463.0.ddobbins@juno.com>
Rendered body type: text/plain

For Seattle area APRS folks.... Just a reminder I'll be giving the APRS demo at the Boeing Amateur Radio Club (BARC) monthly meeting in Kent, Dec. 7th, 10:00 a.m. Following that, at 1:00 pm, the Puget Sound APRS group, led by Doug/K7IP, will host a coffee at nearby Kent coffeehouse. Details to follow. I think I remember hearing Doug say he'll buy the coffee and pie. I may have been dreaming, I don't know.

FYI, Gervie/W7FEN is now a WIDE. Thanks to Doug/K7IP and Richard/N7RIG for the help. This should improve Seattle APRS activity until we get the remote WIDE digi up and running. An outgoing path of WIDE,WIDE,N7REM will get you coverage throughout Puget Sound, down to the Chehalis area, where I'm located. Please don't WIDE,WIDE,WIDE as the packets will be duplicated.

Also, for those of you on the Bremerton side... I'll do the APRS dance again Dec 13th at the Belfair Radio Club dining out. Contact a club member for details.

Any ID-MT-WA-OR APRS not on distro for the monthly Greater Northwest APRS newsletter, please email me direct with name/cs, address, phone number, email address and general info. Thanks.

Don't forget to visit the GNW APRS WWW Home page hosted by Tom/KC7DRX:
http://www.hurricane.net/~eyephrase/aprs.htm

688. Registration

From: Ron Drumheller <k3nxf@silcom.com>
Date: Sun, 24 Nov 1996 20:46:50 -0800
To: aprssig@tapr.org
Message-ID: <199611250446.UAA04297@beach.silcom.com>
Rendered body type: text/plain

```
Hi Bob,

I saw APRS about a year ago at the Pacificon Convention near Sacramento, Ca.
I obtained a diskette but did not do anything with it at that time.  I was
really impressed with the idea.  We can really use something like this for
our ARES operation here. We also do many public service events in the area.

Last weekend I attended a Search & Rescue Symposium at Vanderburg AirForce
Base. There was a presentation on APRS there and that did it for me.  I can
home and found the diskette and unzipped the programs.  My two friends and I
also purchased a Garmin 45XL GPS.  I don't even know how to use it but it
should arrive at my house by this Wednesday so I can spend Thanksgiving
getting to know it.

I am realy having quite a time trying to figure out your program.  I wish
with all the documentation that there would be a "Getting Started" document.
You know, first do this, then do that, etc.  I am getting the feel of it but
it will take some practice to get eveything right.  My other two friends are
depending on me to teach them.  There are also about five others that are
watching to see what we do with this new Amateur Radio concept.

I have found out the hard way that the program will not save any of my
information.  I found a statement that the program will only save when it is

registered.  I also have an old copy which is 7.3d.  I will download the
most current version tomorrow from TAPR.  I do not have my LAT/LONG yet
unitl my GPS arrives and I learn how to use it.

Would you trust me with the unlock code for the shareware registration and
the registration of the GPS.  I WILL send you a check for $33.00 by the end
of the week when I get my LAT/LONG and the version of APRS.  If not, I will
just have to wait for a couple of weeks until my check gets to you and you
mail the codes back to me.  My other two friends WILL register their copy of
your software as soon as I show them how to use it.

Whatever you decide, I understand, but it would sure help if I could get
started without having to wait a couple of weeks.

Sincerely,
73,

689. Garmin 210 auto turn-off?

From: rogerwn7m@juno.com (Roger J Attwell)
Date: Sun, 24 Nov 1996 23:25:45 PST
To: aprssig@tapr.org
Message-ID: <19961124.232553.7622.5.Rogerwn7m@juno.com>
Rendered body type: text/plain

```
Does someone know why a Garmin 210 chart GPS turns itself off at random
times. I suspect it is a combination of weak signals and bad ignition
noise making operation undependable, but you'd think it would just give
a warning message, not turn off. More than one unit has done this. A
higher antenna mounting didn't fix it.
```

One of the problems, APRS-wise, with the PK23 is that it can send too much
information to the computer which will prevent APRS from doing it's thing.
Set the MON to 2.  This will limit the packet description, generated by
the PK232, from interfering.

KPC-3 TNCs that are set to becan at specific times i.e. every 5 mins at
10 seconds after the minute, will at certain times send continues POSITS
for a solid minute.  I don't know if Kantronics ever fixed this.

Mark,

I had browsed my way through the symbol list of WinAPRS to see what
was in there, following some discussion of available symbol types
here on the SIG, and it locked up on me.  At that point, the only thing
in control was the reset pushbutton.  That was under the 1.1.7 BETA that
you had sent a few of us, and it consistently froze about symbol #22.

I finally went and retrieved the regular 1.1.7 release from TAPR and
just now loaded it, and this time it froze again, but at about symbol #18
or so.  I didn't take the time to see if it would repeat at that point.

I am running Win 3.1 and Win32S, with a 386 system with 8B of memory,
and one TNC.
```

I got the registration OK last week, thanks.

693. NTS traffic via APRS

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 25 Nov 1996 10:43:04 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.961125103025.19742A-100000@arctic>
Rendered body type: text/plain

Seeing that many routine NTS messages are pretty compact and that many EOC's already have packet stations for NTS but are hesitant to replace that capability with APRS, I thought it might be handy to have a modest NTS capability in APRS. To explore this idea, I wrote the attaached test program to show how it would look in APRS and how the operator would be prompted for the information in standard NTS format.

Just cut off this text and run this under QBasic...

```
CLS : SCREEN 9
PRINT " This program suggests how I might add an NTS delivery page to"
print " APRS.  NTS messages are usually very brief and can probably be"
PRINT " handled in APRS with little problems with congestion during"
PRINT " routine operations.  For BULK handling of traffic or during heavy"
PRINT " use, this type of traffic should best be handled on alternate"
PRINT " frequencies using standard ax.25 packet."

I actually got a phone call from Mike Lamb N7ML (AEA Pres.?) regarding a gripe I had with the DSP-232 I had just purchased. I also have spoken to their tech support line, and I just got a firmware upgrade in the mail. (Not the one they promised, though.)

I don't think they're exactly out of business...

695. PARS Documentation

From: rbeckett@Schwab.COM
Date: Mon, 25 Nov 1996 08:28:22 +0000
To: aprssig@tapr.org
Message-ID: <9611251628.AA16390@sv0001dev.dev.schwab.com>
Rendered body type: text/plain

I have been following the Prs sig for several weeks now. I have downloaded wqprs117 and tried to understand how this new apsect of ham radio works. I can't seem to find a good set of documentation which presents a coherient explanation of aprs operation. For example, I see references to WIDE.WIDE.WIDE but I have no idea what it means and how should I set up my system.
Currently I would like to be able to track aprs units in my area or even world wide if that is posiable. My station is on s sailboat in the San Francisco bay and I figured out how to enter the appropiate information and sysbol but it was not easy. I had to use a lot of intution to get there.

Rendered body type: text/plain

Hi.
  I'm one of the purchasers in the second batch of GPS-20's from TAPR.
I'm also part of the TAC-2 alpha group. I have a couple of questions
that I thought members of this group may be able to help me with:

1. Is there a WWW site that describes the NEMA command set for GPS's like the GPS-20? I have the Garmin docs. Just wanted a larger look. By the way: Is the "*hh" at the end of all sent and received sentences a hexadecimal checksum? It's never called out in the doc.

2. I've had a hell of a time trying to access my serial I/O under DOS 6.0 from Borland C++ and would like to put together a series of code snippets for the TAPR/TAC documentation that show how this can be done from a number of languages for both the PC and Mac. Do any of you have snippets of this type that you'd be willing to share for this purpose?

Best 73's--
  and best wishes to all non-ham members of this group...

Professor Noam's callsign is KE2PN.  He's given congressional
testimony about spectrum auctions too.  Every year, 20-30 of his MBA
students in Management of Information, Communications and Media
get their Technician licenses as part of a course he teaches
(primarily at exams run by our VE team which we bring over to a
lecture room in the B-school since they wouldn't fit in our little
conference room).  We've tried to get his students to stop by the
W2AEE shack and operate but they are generally too busy with their
coursework (as is the case in general with students here).  But at
least they are a little bit familiar with the Amateur Service and
might pick it up later...

Noam is the director of the Columbia Institute for Tele-Information, CITI.
See http://www.ctr/citi/index.html if you're interested.

After I read the article maybe I'll approach him with an APRS demo.
He strikes me as being much more on a theoretical plain though,
not to mention way too busy....

Full documenatation is at

        http://aprs.rutgers.edu/APRS/

If anyone has problems getting it, drop me a note DIRECTLY (not to the sig)
and I will email you the docs, specify if you want them in TEXT form or
HTML, I recomend HTML, you then open the file in netscape and get all of
the graphics.

By having it locally you do not have to wait for the speed of the net to
get the info.

Mark

Bob, it looks great!   I don't have QBASIC, so I can't see it, I had to read the code to see what was happening.

Some additions, if possible: There is a second BT after the message, immediately before the signature. This is NTS std.

Our practice in the EOC and ARES nets is to also include at in the SENT and RECEIVED blocks, the actual operator callsign doing the work, along with an indication of net or freq. This is, of course, only for our end of the message.   We have the callsign of the end sending it or taking it from us, but that callsign is quite often a club, RACES or ARES callsign.   Example for this msg:

Received: N3VEJ 11/25 1703est Via SIG   Sent: ...

Also, the only time both Sent and Received would be filled in would be on a copy that was relayed through the particular station.   So a Sending station would get the mark in SENT,and the Receiving station gets the same timestamp in it's received field, but with a different operator ID.

Doug

ps. Wish you coulda played in the hunt. He was on top of a 833' hill at Prettyboy Elem, Balto Co map page 2, down near the bottom.   Chuck was then at Hampstead Elem, also a very high spot.

Rendered body type: text/plain

```
If the subject line is BOLD and threatening, it looks like it gets read,
and I thank many of you who have responded here on the SIG and directly
to me.

The issues with WA4SSP-14 I am certain will be resolved quickly if not
already as I write this.  From getting 4 position reports in each packet
burst, and then the ping-ponging effect of going through too many WIDEs,
it was just too much.

I have given up on the WX station issue and will continue to lock him
out.  So far, so good.  The computer hasn't crashed again if four days.
The WX station is 125 bird miles away and not direct anyway, so I think I
can afford to pass on that.  There are a lot of Northern Virginia
stations that should have a better opportunity to observe if there is
really bad data coming from him much better than I.  If someone does
figure it out so that I can kill the filters,or change some other
parameter here, so much the better.

Thanks again SIG for the feedback.

705. [APRSSIG:6738] Re: MIM Module Problems??

From: Terrance Kealey <tkealey@mdc.com>
Date: Tue, 26 Nov 1996 12:53:43 -0600
To: aprssig@tapr.org
Message-ID: <s29ae8c7.034@mdc.com>
Rendered body type: text/plain

```
Mike,
I have the same problem with the beacon text being transmitted every
few second when using the MIM and GPS-20. This usually occurs for
about 2 minutes after turn on - until the position becomes valid. It will

also occurs 30 seconds after you lose satellite lock. My work around
has been to connect a switch and LED to the PTT out line and connect
the PTT after the LED quits flashing every few seconds. Another option
is to turn off the beacon text. As long as the RMC data out of the
GPS-20 is valid, the MIM works great.

I think the problem is the result of the GPS-20 using a few more decimal
places for some of the data fields. This caused a problem with the MIC
Encoder velocity being output incorrectly. I just received an updated
controller chip for the MIM module and my preliminary testing indicates
that these problems have been fixed. I did see a few oddities, but due
to it being late at night when I played with it and the need for a wiring
modification, I will need to look at it closer. I will probably not have time
to do any additional testing  until after this week end.

The other problem you had with the EEPROM data being lost is also
something that I have experienced. This would happen if I cycled
power a couple time in quick succession. I have not had this problem
for awhile, probably due to my not resetting the GPS as much since I
threw out my patch antenna and got an amplified mag mount. The patch
antenna was only receiving about half the satellites and I would cycle
power to both the GPS and MIM (only one power input) because I
thought the GPS was locking up. I probably dumped memory 3 or 4
times doing that, but since it is now powered up when I turn on the
ignition, I have not had any problems.

I don't know if this has been any help, but I have seen the same
problems.

Terry, KI0BF

>>> <AC6JA@aol.com> 11/24/96 05:19pm >>>
finally hooked up my MIM module to the GPS-20 gps card but am now
having problems.  gps card now doesn't seem to want to lock on to any
satellites.  i am using the trimble mag mount antenna.  when i use my
garmin 45 with trimble antenna and data out hooked up to MIM module,
everything works fine.  the biggest problem seems to be if i enable the
beacon for my beacon text and i don't have a lock on any satellites, my
beacon goes from once every 20 minutes to once every THREE
seconds.  problem goes away when there is valid gps data on pin 20,
like when i hook up the garmin 45.  had been using the gps-20 for quite
some time in the truck with no problems.  i am using a 7805 regulator
for the 5v supply to the gps-20 and under load puts out 4.97vdc.
 am powering the MIM module with 12v to pin 1. also had a problem
with the MIM module losing its stored data just by turning the power off
and on.  seems like it's doing a reset after so many powerups? any info
from anyone who's gotten the abovementioned items working would be
GREATLY appreciated! thanks!

Mike  AC6JA

707. Question on APRS Routing (flooding)

From: Richard Parry <rparry@qualcomm.com>
Date: Tue, 26 Nov 1996 11:33:48 -0800
To: aprssig@tapr.org
Message-ID: <v03007802aec0f3124b51@[129.46.159.136]>
Rendered body type: text/plain

```
Can anyone answer this APRS Network Routing Question ("Flooding")

Question: As I presently understand APRS routing, it seems the APRS routing
scheme of using RELAY and WIDE to repeat a packet should fail.

    For example, assume I send:    W9IF>RELAY>APRS etc. etc. etc.

    Now if all the "RELAY" stations that hear my packet repeat my packet,
then they will all collide with each other, right?  This is called flooding
in network terminology.  In other words, it sure seems like the network
will "explode" with everyone repeating my packet at the same time.  What am
I missing?

    I know that I am wrong since APRS works, but I sure don't understand
where my reasoning fails.  Thanks in advance for anyone explaining this.

I have never had this happen and I built two each of the GPS-20 and MIM 1.06
combos to make two standalone trackers.  Maybe something was fixed in MIM
version 1.06 or...

Maybe you don't have your parms configured... everything works from the base
period (PER) so it must be set first. The BEACON period, the TELEMETRY
period, and the POSITION period are all multiples from the base period.
Sounds like you may be transmitting data in the "raw" mode... check the
docs... they're pretty clear on this.

Even if no POSITION, COURSE, and SPEED data is present out of the GPS-20, it
will still send NULs to let you know it's alive. That's handy!  What version
might y'all be running (MIM) and what do your parms look like. I'll help if
I can.

W2HOB REPLY:

If you're a mobile (the only stations that should be using RELAY,WIDE, etc),
then the chances of very many RELAYs hearing you are reasonably low.  Only
the ones that hear you will digipeat you... yeah, some collisions but not to
the "flood" extent and not serious.

APRSdos REPLY/COMMENT: How many other stations will really hear you
direct?  Maybe one or two.  They will both digipeat you once..  THey might
colide, (for someone listeneing in the middle between them, but their
packets may be heard separately by more distant stations.  But no one else
willl digipeat since these first 2 used up the RELAY hop.  This is why you
should NEVER send via RELAY more than one hop and RELAY, if used, should
be the first DIGI hop...

thanks for your info. talked with will clement with clement engineering and he advised me that the problems i and you are/have had are due to bugs in the original eeprom. he advised me that a new eeprom is available for $20.00! i kinda felt that since the original MIM module could have never worked properly as i got it originally, that the new eeprom should not cost me anything. talked to will about this but i still have to pay an additional $20.00 to get the new eeprom. oh well, what can you do? got to have to corrected eeprom to get it to work properly. guess clement engineering also has a new MIM module based on surface mount components that is much smaller than the ones we have. they are also the same price of $90.00.
anyways, thanks again for the info, and will look forward to getting my new eeprom.

Mike AC6JA

Rendered body type: text/plain

thanks for your response. talked with clement enginnering and he advised me that my problems are due to me having an earlier version eeprom with those particular bugs. now i have to send in an additional $20.00 to get the newest version eeprom that fixes the MIM module that will never work right until that chip is replaced. oh well, what else can one do? ordered my new eeprom today and look forward to getting it all working correctly soon. hope

```
there aren't any "more" bugs that we have to pay an additional $20 to get
fixed.

thanks again.

I copied your information and it was very helpful but I still don't
seem to be able to find a good set of documentation which will tell
me what this WIDE,WIDE,WIDE is about. I know it is in the TNC
settings but I don't know what it means and it's not described under
the "Settings" - "TNC" section of the documentation you sent me. It
does appear under "UNPROTO path"
The documentation says "Do NOT put more than one GATE in your path."
but the default shows "gate,gate,wide"
I don't understand what the Gateway item is. Perhaps it doesn't
matter in my case at this time. However I do know that eventually I
will be running both VHF and HF from my Kantronics Plus.

>I copied your information and it was very helpful but I still don't
>seem to be able to find a good set of documentation which will tell
>me what this WIDE,WIDE,WIDE is about.

The following paths are NOT considered good practice and should not normally be used... and if you do, some Do-gooder will fuss at you...

```
   RELAY,RELAY     - Some RELAY stations will never hear you due to colisions
                     but his may be ok if there are NO WIDES and no single
                     station has any better HAAT than any other
   .....WIDE,RELAY - NEVER do this.  EVERY home station for 50 miles will
                     key up on your every packet!
   WIDE,WIDE,WIDE  - Gets you out 3 hops in all directions but also results
                     in as many as 27 duplicate packets plus 30 seconds of
                     airtime.  Dont DO THIS!  No one will get through...
   WIDE,GATE       - You are QRMing the HF net which you cannot hear!
   WIDE,GATE,GATE,WIDE - You are QRMing every APRS net in the country!
```

The following paths are reasonable and are used under the circumstances shown:

```
   RELAY       - Default.  GOod starting place to see whats out there
   WIDE        - Covers your local area if there is a WIDE
   RELAY,WIDE  - Can link you into a WIDE but only if you cannot figure
                 out the call of your neighbor that is RELAYing you
   WIDE,WIDE   - Gets you out 2 hops in all directions with minimal foldback
   WIDE,WIDE,W3XYZ,W4XYZ - Gets out 2 hops in all directions and 4 hops
                           in the direction towards W4XYZ
```

hope this helps you out...

```

Hi to all (Siggers),
    REMYMSG 19TH on javAPRS active APRS MAPS and Win3.11..

  Want to thank all who responded to my msg. Steve/K4HG and
note his TIGER.GIF map of SanFran Bay area worth looking at,
and saving as a GIF file, Steve is it available in DOS file
format for Art/N2ZRC, he save all DOS maps he can find.???

Thanks to Marley & Hasan, who advised I have to again support
Mr. B Gates and his monopoly (He has enough money now). To
run javAPRS you gotta have WINDOWS 95.. The time of the year
to say Bah Humbug to that...

   I did find two places to dowload Win32S for Version 3.11
the 32bit version vice 16bit made for V3.11..

     The MS Web site, their file called PW1118.exe 2,174Kb file.
or and appears to be the same file/data/# of bytes. at
     http://www.ncsa.uiuc.edu/SDG/Software/Winmosaic/win32.htm..

They both have same nr of bytes in the file, so appears to both be the same.

    I download it to my V3.11 and took it fine added a bunch of
new files, but so far everything seems to be running ok and same
as before, except it will not run APRS active maps. I get the
very same statement as before.:
    "Sorry, your browser isn't Java compatable!!!!! "

   With Netscape Gold Ver3, booted up, under OPTIONS, NETWORK
PREFRENCES, LANGUAGES, it shows JAVA/JAVA SCRIPT. With two
boxes to mark X.. Enable java (real light and caint Mark)
     Have Marked "X" Enable Java script... (Only one can mark)
but still Java error msg not compatable comes up.. ????? Why..

  If javAPRS requires WIN95, what browser file or combination
of browser type files within WIN95 is required, anyone know
which ones and can they be loaded into Win#.11 for Work groups.
??? Big question of the day. Caint we steal couple of Win95
browser files and put em in Win3.11 ???

 Or, what is required to get javAPRS to work with Win3.11 ???
How about it programmers, everything else in this crazy computer
business can be written, anyone take a stab at this delema ???.

    I just don't want to DONATE, to GATES's palace in Puget
Sound again, and have to purchase Win95..

   And Cap, thanks for your input, have downloade the MS support
files you suggested but have not read them as yet. Located at:
   http://www.microsoft.com/windows/support/supptools.htm
consisting of 1. ASSIST.EXE 1,320.501 bytes, and WIN95APP.EXE.
Couple of HTM files, COMPATLI AND HWTEST...

  Again thanks all for your responses. I guess it's WIN95 or won't
see the active APRS maps in other areas.

  And I hope this is the last one. Delorme Trackmate in the TIGER
Software latest mail order catalog, is $199.99... "Never Get Lost
Again", yeh right..!!!!

    73's & Enjoy, Bill/WB6LPG

I let him know last evening about the prototype code we saw here.   He's the

fellow that wrote the book I passed along to you, and he came up with the
mod for the callsigns in sent/rcved blocks.

He is quite the traffic handler, regularly scoring 120 or better PSHR every
month.

With the upcoming activity we're hoping for with Skywarn, it's a welcome
addition.

We're grateful that you're considering the idea.

Doug

I have two kits while bought last summer, ive had no time to do.... after
studing the instructions i was lost on a box to use till i saw Bob's display
(pretty neat btw, if u can get to see it - just watch out for the nails in
the back : anti-swip devices i think)
standard hobby box from RS is fine... well if ive got bad eproms i do not
need to spend $20 for a replacement. two thoughts cross my mind -

first, arent EPROMS reprogramable.... seems simple. if it's too much more
complicated then that well ...

second, the clerks office only charges $15 to file a small claims suit and
imagine that!- when under $2500 these suits can be served by first class
mail....

but anyway, why wouldnt reprograming work???

Good Turkey (if not chips) to all!!
Dan Ka. / Chicago!

In a message dated 96-11-26 19:43:39 EST, you write:

<< hanks for your response. talked with clement enginnering and he advised
me
that my problems are due to me having an earlier version eeprom with those
particular bugs. now i have to send in an additional $20.00 to get the
newest version eeprom that fixes the MIM module that will never work right
until that chip is replaced. oh well, what else can one do? ordered my new
eeprom today and look forward to getting it all working correctly soon.
hope
there aren't any "more" bugs that we have to pay an additional $20 to get
fixed.

thanks again.

Message-ID: <199611270800.AAA19041@big.fishnet.net>
Rendered body type: text/plain

OK guys and gals,
  Obviously I am doing something wrong. I am using my GPS and a route, setting it to active, setting my speed to 60 mph. I am not seing more than one position change on the map each time I try this. I look in my tk262217.hst file and I get about three or four entries and that is it.

What are the secret handshake buttons to push/set to be able to bring a route from my GPS, run it hooked up to APRS, and then go in and edit the map using mapfix27???? I am trying to learn how to make these maps for Ventura California for our ARES/RACES to get APRS going.

Oh by the way Bob and gang, The Vandenburg Search and Rescue Symposium was a great hit and about 6 main ARES/RACES players in Santa Barbara County, and the Lompoc area have started to learn APRS, sending in there Registrations, and are buying GPS's to get that county up and running. We are still hoping to connect the great bunch in San Diego County and LA County to Ventura and Santa Barbara County with wides so that the west coast can get on the ball.

Again thanks for all the help thus far, now if we can get this GPS/Mapping down we can really get going.

Sincerely,
Dan Dicke

It's true. While "the doors are open", it's only the owners trying to wring the last dollars out of the standing inventory. Manufacturing was shut down weeks ago, and all the hired help has been laid off.

This is on very reliable authority - my wife and I have a good friend who is in the surplus electronics business, and their company was approached by AEA three weeks ago regarding a "buy" of the inventory. (No deal - price wasn't right.)

If, as an end-user, you call and ask AEA they'll paint the illusion that everything's o.k. - but it's not. They have a vested interest in keeping the news positive so as to stave off the fire-sale pricing as long as they can.

I am having LOTS of trouble with the aprs/java sites. I
am testing Netscape/2 (for OS/2) beta 2, just released. Bob's site is very
slow to respond to me and I have been unable to
see anything, other than the opening menu. DSY's site is much faster, and
while everything loads and looks like it works,
I never see a map.

On the other hand, when I visit KL7J's java enabled site, all the java
stuff works great. (This is a very impressive URL, if you have never
visited it.) Doesn't require JAVA, but if you have it, the display is
quite something, especially page 2.

The URL is: http://www.alaska.net/~buchholz

A gold mine of ham radio info and resources.

       results in as many as 27 duplicate packets plus 30 seconds
       of airtime. Dont DO THIS! No one will get through...

Depending on topography and station density, there are those areas where
the setting above is "normal". We have been running with w.w.w. for over
two years and the system works very well, BUT: station density is low,
paths are very sketchy at times, and most paths are quite long.

I guess the locals here don't fall into the "Do-gooder" category, or they
would have to fuss at every station in the network. Again, I'm NOT
recommending this approach, just indicating that every instance of it does
not make a lid. If things EVER stabilize here in terms of long-term
committment, wide coverage digis, etc., I am sure we will move away from
it, but I ain't holdin' my breath. 73,

APRSdos REPLY/COMMENT: I started to write a long explaination, but just erased it all to offer just the following:

For now, Will has been un-employed (with a 6 member family) for almost 6 months hoping to build the APRS MIM and MIC-E into a viable business. THe MIMs are one time programmable chips. So far he is thousands of $$$ of his own savings in the red. If he has to give it up and go get a real job, then you can kiss the MIM and the MIC-E goodby.

He is doing everything he can to give us the MIM and the MIC-E, but some of the newer NMEA formats by some of the GPS manufacturers confuses some of the early MIM chips. He only has a few different GPS units to test with, and the MIM's worked perfectly with these...

So please bear with him and consider that it does take him time and effort and new chips to respond to some of these unique problems.

See APRS LIVE: http://web.usna.navy.mil/~bruninga/aprs.html

The beta versions of Netscape are always full of bugs, and the betas involving Java are especially bad. It turns out that so far Java is far from the ideal cross-platform tool, as versions for different OSs seem to have different problems. That's the price for being on the cutting edge.

One thing that I have seen as a problem is that Netscape's caching mechanism seems to cause errors. Go to some non-java page, then use the clear cache now button in the network options dialog box, the go to the java page. That may help.

Other than that, just tough it out and wait for beta 3!

Well put Bob. I don't think that most people comprehend that it sometimes
takes more time and effort to make a "Simple" circuit perform assigned tasks
than a more complex circuit. They are probably also unaware that the program
is actually burned into the microproccessor chip itself, making the whole
thing useless if the program needs to be changed.

Keep up the good work guys!

If your hardware is capable of running Windows 95, it is also capable
of running Linux, which is free, and is The One True Operating System
(see http://www.cc.columbia.edu/acis/sy/dilbert-unix.gif).  And Linux
Netscape runs Java.  You can also install the Java Development Kit
(free), run appleteviewer, develop your own java apps, run your own
web server (free at apache.org), etc.  Using the Linux AX.25 code
(free) you can even run one of those nifty live Java things like the
ones that folks are running on OS/2, etc.  I'll be uploading one for
Linux AX.25 shortly.  Have tested it with a TNC-2 and Baycom so far.
Hopefully I'll get the time over the loooong weekend to finish it
off.

All you have to give up is all those horribly useful commercial apps
like spreadsheets, wordprocessors, bill-paying, etc.:-) (Actually, you
can dual boot between Linux and whatever so your children can still
run Lion King Activity Center and Mixed Up Mother Goose.)

See http://sunsite.unc.edu/pub/Linux (especially the HAM and AX25
HOWTO's).  When I say Linux is free, that of course assumes you don't
mind FTPing and copying 50-100 floppies.  You can buy CDROMs of it
too but what you are paying for is the CDROM vendor's efforts, not
a license for the software (which is free).

Just pointing out that if you are up for a computing adventure that
will suck down hundreds of hours of your time, you can avoid
supporting Bill Gates.

For those thinking about Linux, as I have stated before, we ARE working on
X-APRS which will be APRS for X-Windows.  For those that dont know,
X-Windows is the GUI (Graphical User Interface) for Unix.  X-Windows runs
just fine on Linux.  X-APRS will be the SAME code as MacAPRS and WinAPRS so
you can be assured of compatiblity and a feature rich system.  We HOPE
(this is NOT a promise) to have X-APRS ready to ship by Datyon.

When we release X-APRS we will be releasing for three platforms

        Linux on PowerMacintosh
        Linux on Intel PCs
        Unix on Sun Sparc

We WILL add more as the requests and resources become available.

I ran across a decent deal the other day, So I figured I would post
it......

WEST MARINE SELLS a Garmin gps TRAKPAK
Which is a computer mouse sized Mag mount creature with a pig tail like a
mouse.
It is about $220
It has the same 8CH parallel RXCV as the GPS 20,38,40
It is a sealed unit that can be magmounted
They also sell the marine DGPS RXCV
There is also some new kind of moving map attachment for the gps RXCVs
They also sell some WX stations
They do buisness both mail order, Online, and in person
there is one in Dallas and several in other cities nation wide
TRY the web site also at
http://www.westmarine.com

Hi All,

On Tue, 26 Nov 1996 Geoffrey Dick pointed out:

>Bob Bruninga has an 8 page article featured in it, beginning
>page 10, with lots of illustrations.
```

Yeah, neat article but how come I've never seen those "SKYWARN", "DIGIPEATER" or "DX SPOTS" legends running across my screen? Is this some hidden, undocumented feature of APRS Bob hasn't told us about?! ;-{) 73

Arte Booten <N2ZRC@gnn.com>
(Packet Radio: N2ZRC@KB2VLX.#BRONX.NY.USA.NA)
[Cruise Missile Coordinates: 40 52.69N / 073 54.06W]

... Sensors say there is nothing at those coordinates ...

Brian Fair sed:

> It has the same 8CH parallel RXCV as the GPS 20,38,40

Not quite. First, it is a SEQUENTIAL receiver, like the 20/38/40

It's not like the '20 because you can't get the precise timing pulses from the receiver and some of us are finding that to be useful/important. [I believe it IS a 20 inside the box. But you have to break the sealed case open to get to it].

It's not like the 38/40 because it has no display, no waypoints, no track log, etc.

745. javAPRS Update

From: Steve Dimse <sdimse@bridge.net>
Date: Wed, 27 Nov 96 16:27:54 -0500
To: <aprssig@tapr.org>
Message-ID: <199611272127.QAA10044@newworld.bridge.net>
Rendered body type: text/plain

I have put version 1.0 of javAPRS on the TAPR ftp site. All sites using javAPRS should upgrade.

ftp://ftp.tapr.org/tapr/SIG/aprssig/files/javastuff/javaprs.zip

This version greatly improves on the handling of TIGER maps. Most importantly, one can zoom and scroll around on a dos map (which is fast) to get the view one wants, then hit 'T' to get the map turned into a TIGER map...you don't have to wait 15 or 20 seconds for a new tiger map each time you zoom or scroll.

You still need to run javAPRS with the applet runner or through a server that supports map relay, and the tiger maps are not well calibrated at large scales.

The new version also corrects some parsing errors, most notably with the new lower case weather format.

An updated users guide is also provided in the zip file, or can be read at:

http://www.bridge.net/~sdimse/javAPRSprog.html

Thanks everyone for all the input you have provided to improve javAPRS. I need to put it aside for a while so that I can get APRServe working, a java program to link a variety of different live TNC sites.

I will fix any bugs that are found, but no new features for a while. If you have ideas feel free to let me know, but don't be surprised if I don't act on it for a while.

Steve K4HG

Don't know who you are calling but as far as being told that everything is
OK I find that hard to believe. I called yesterday to try to get a final
EEPROM upgrade for my PK-900 and I get voice mail saying that AEA is selling
their lines and are no longer in business! Please call the ARRL (why the
ARRL??) in a month or two if you have any service problems! If you have a
direct extension to dial please enter it now.

Please give me the number that you are calling!! I will be more than happy
to give them a order (COD of course!)
and take one of those EEPROMs off of their hands.

Well there are linux spreadsheets, wordprocessors (Caldera offers
WordPerfect) and even checkbook programs. They might not have all the
WinDoze bells and whistles, but who really uses them. When have you
really needed anything more than WordStar, or maybe WP50

Hello,

It looks like the pin used for RI goes to the center pin of the three pin
power plug on the board.
Do not feed 12 Volts into the receiver! The Caps on the DC line are rated
at 10 volts and the
DC-DC convertor has a maximum DC input of 11 volts. Someone has used a
7.2 volt nicad pack
to power it. I would use 6 volts if possible and not to go over 8 volts.

There are also Trackpack 35 units made (12 channel)
The 35 has a true parallel receiver- I think the 25 does, too.

There are also Trackpack 35 (and I think 25) PC models, with a 9 pin DB
connector.

Compare apples to apples
To the best of my knowledge, (havent thought about this in awhile) the GPS
38 and 40 *are not 8 channel parallel*. They are 1 or 2 channel multiplexing.

>
> AJ
> ajdel@interramp.com

I'm the guilty party AJ is referring to transmitting DGPS signals in
the Baltimore/Washington area. My W3IWI-13 amateur packet radio beacon
sends out DGPS signals on 145.79 MHz with a 20 second update rate.

The signals are derived at the geodetic GPS site called GODE at the
NASA Goddard Geophysical & Astronomical Observatory (GGAO) in Green-
belt MD. GODE is a permanent station in the IGS (International GPS
Service for Geodynamics) and hence the position it uses to develop
the DGPS is referenced to the ITRF (International Terrestrial Reference
Frame) at the cm level. The GODE antenna feeds a multi-port power
splitter and the DGPS signals are generated with a commercial Trimble
4000SSE geodetic receiver. The amateur equipment begins at the SSE's
RS232 output where conventional amateur practice is used. The DGPS
signals are relayed via other amateur stations (called digipeaters)
to a coverage area that includes the Chesapeake Bay, most of MD,
northern VA, and nearby areas in NJ, PA and DE.

The original thread asked about monitoring the positions of vehicles,
and one reply was that you should look at the system developed by
Bob Bruninga for amateur work called APRS. You can find out all about
amateur digital communications in general and APRS in particular by
browsing the TAPR web pages at

        http://www.tapr.org

Regards, Tom Clark

Hi All,

I found this multi-part article on the AX.25 PBBS system. Seems to me I recognize much of it as coming straight from Bob's README files and a snippet or two from stuff I wrote. I don't know about any of you, but I have no problem answering APRS questions from interested individuals and resent this person's "protection." But if it gets more people interested in and running APRS I guess I can't complain too much.

Title       : An Intro to APRS Part 1 of 5
```

ACKNOWLEDGEMENT

As many of you know, I recently posted a bulletin at ALLUS asking for information on APRS. I expected a few replies, and just enough information to tell me if I wanted to investigate it further. Instead, I received many responses, some of which provided the excellent and comprehensive information I have included here. This article is a summary of the information in those responses that arrived from all over the country. I am especially indebted to those hams that that went to the trouble to provide the history of APRS.

I have deliberatly omitted the call signs of those who contributed so that they will will not be besieged by requests for more information. Although the list is a lengthy one, I could have included it in this article. I am certainly not trying to take credit from these talented individuals, but feel that their privacy has the highest priority. I have included a bibliography at the end of this article for those of you who want to investigate APRS further. That bibliography was also provided by one of the respondants to my request. To all of you, I extend my most sincere thanks.

Larry Phillips KC7LVZ

HISTORY

The Amateur Radio Research and Development group (AMRAD) was instrumental in developing the original specification for AX.25 written by Terry Fox, WB4JFI, and published by AMRAD in 1984. In 1978, a member of the AMRAD board of directors built the first digital on-the-air automatic message system. It was a dual port phone and packet radio BBS for the AMRAD group when ASCII first became legal in the late 70s.

In 1982, he wrote a data mapping program that took Navy HF position reports off the air for display on an APPLE-II computer. In 1983, he wrote a BBS/GATEWAY program for the VIC-20 computer to permit simultaneous operation of both HF and VHF ports for exchange of packet messages. This was among the first, if not the first, amateur HF BBS/GATEWAYs. It remained on the air continuously for 5 years through 1989 under the FCC STA for automatic packet HF operations. He also pioneered the use of the 200 Hz shift for HF packet operations, and used it with cross-country links to stations in zones 0, 9 and 7.

The idea for an automatic connectionless protocol reporting system was first used in a VIC-20 program for reporting the position and status of horses in a 100 mile cross country endurance run for AMRAD. For the next two years, the idea was developed for amateur packet radio support of the National Disaster Medical System exercises sponsored by FEMA. At the time it was called the Connectionless Emergency Traffic System (CETS). After the second national exercise, the Commodore was dropped, and work began to port CETS to the new IBM PC. Packet mapping was also integrated into the program.

In 1990, all the features that had been incorporated to that point were combined in a single program written in TEXT format, so any ham could draw a map using any ASCII text editor. It was written for the East Coast of the U.S.

While this was going on, another AMRAD member was working on the idea of integrating packet radio with the (then) new Global Positioning System (GPS). The GPS sent latitude and longitude data to the TNC. It was used when midshipmen at the U.S. Naval Academy ran in relays from Annapolis, Maryland to Philadelphia, Pennsylvania for the annual Army-Navy football game. The progress of the runners was tracked through an APRS unit that was installed in a football helmet. Since then, the idea has grown dramatically.

APRS: POSITION THROUGH PACKET

The Automatic Packet Reporting System, or APRS, is a position reporting and plotting system that uses dedicated computer software to extend the capabilities of any packet station. APRS differs from Ax.25 and TCP/IP in that it uses a connectionless protocol. Instead of connecting to another station as you would do in normal packet operations, the APRS software uses your packet station's BEACON function to transmit your location in longitude and latitude coordinates. When you receive APRS transmissions from other stations, their locations are plotted on a map created by the program on your monitor screen, which is why it is also referred to as a Graphics User Interface (GUI) program. Adjacent to each plot is the station's coordinates in latitude and longitude, and an optional brief comment on the station's output power, antenna height, type, and so on, and what type of station it is (base, portable, mobile, weather, etc.). This plotting capability makes APRS a very versatile packet system, allowing the user to participate in many packet activities.

JUST THE FACTS, MA'AM

Whenever you send an information packet using the normal AX.25 protocol, the station you're connected to sends back an ACK frame to acknowledge the fact that it just got a packet from you. Whenever that station sends you an information packet, your TNC does the same. That way, the two stations ensure that they are both talking about the same thing at the same time, and the connection is still good. APRS differs from this protocol in that it uses your TNC's BEACON function to generate your position information in UI (unnumbered information) frames in the UNPROTO protocol. This means that the receiving station(s) will not acknowledge your transmission. Thus, if you want to ensure that your APRS transmission is received by a specific station, you must make other arrangements with that station.

An exception to this is when you may wish to use APRS for keyboard-to-keyboard communication with another station. The APRS software offers this option, and it functions in the same way as normal keyboard-to-keyboard connections: ACK frames are generated for each received information packet. As you might imagine, this would only be necessary when either a new APRS station starts operation, or a APRS station has made changes to the station, and wants to confirm that the changes have not degraded it's performance, or the operators want to exchange some specific information without leaving APRS.

If a station wishes to digipeat the APRS information it receives, the operator can use the ALIAS function of his TNC to select one of three possible APRS digipeater modes: RELAY, WIDE, and GATE. The "default" setting is RELAY, and is used to digipeat APRS data from low power and portable stations. A station with a WIDE setting digipeats to other WIDE stations packets addressed either to its callsign or its "generic" WIDE alias. A GATE station transmits to other GATE stations for crossband digipeating: VHF to HF, HF to VHF, or HF to HF. So, by selecting the alias, you can direct the APRS traffic to "targeted" stations. The advantages of crossband digipeating to and from HF are obvious. Since HF involves skip transmission, APRS information can be sent over large areas. Regional networks in the US have been established that cover many hundreds, if not thousands, of square miles, and have a variety of uses.

STAYING ON TRACK

With the advent of the Global Positioning System, or GPS, APRS has matured into an accurate and useful means of tracking moving stations in real time. As mentioned above, this concept was used early in the history of APRS to track contestants in a cross-country marathon. Since then, the ability of APRS to decode the NMEA-0183 GPS serial protocol data has allowed hams to track the movements of mobile and portable stations, and locate stations in remote areas.

Locating a transmitter is made easy using DF equipment and APRS. Antenna azimuth readings and signal strengths adjusted for antenna gain are entered into the system via keyboard. The operator can then draw a circle the radius of which is proportional to the signal strength, or use the azimuth and signal strength readings to plot a point on the map. Points are plotted or circles drawn using similar data from other APRS stations. If three or more circles or plots intersect, the transmitter is close to that intersection. Just the thing for locating a jammer.

APRS can also receive data in real time from weather stations such as those made by Davis and Peet Brothers. The data include wind speed and direction, temperature, hourly and daily rainfall amounts, and sometimes barometric pressure. If the data from enough weather stations is included on an APRS map, a good picture can be made of an area's weather conditions. Obviously, this could come in very handy when the weather turns nasty.

APRS has shown that it can be very useful to participants in the SKYWARN program. By using weather data obtained from APRS, they can provide much more information on storm development, evolution, and movement than they would be able to provide by using the equipment they have on hand at their individual QTH. Better still is the potential ability to track a storm.

By sending mobile APRS/GPS stations out to the periphery of a storm where visual observations can be safely made, the location and movement of many kinds of weather disturbances, including hurricanes, tornadoes, and large thunderstorms, can be monitored. Once the direction of a storm has been determined, an estimate of its path can be made, and warnings issued to those on its projected path to prepare for its arrival.

Since LORAN also uses the NMEA-0183 protocol, APRS can be used to aid in navigation by using the long-established LORAN system. Boaters and pilots are the obvious beneficiaries, as are those adventurers that are equipped for LORAN, but lack GPS capability.

THE TOY BOX

So what do you need to get started in APRS? All you need is your packet station and the APRS software, which is freely available as shareware. If you can access the Internet, the address is:

ftp://ftp.tapr.org/tapr/SIG/aprssig/files/upload

On the World Wide Web, the address is:

hhttp://www.tapr.org/sigs/aprssig/files/upload

A recent version for DOS is APRS77D.ZIP. For Windows users, there is Winaprs 1.10. These programs are rather large because of the maps that they provide, so be sure you have enough storage space on your disk before you start. Another source is one of the many ham-related BBSs that have a version of the APRS software freely available for downloading from the hard drive.

Your APRS station can have virtually any level of complexity you can afford, from an IBM compatible 8086 computer to the latest Pentium-powered full-size and laptop machines. You should have a hard drive in your machine, and a color monitor, but a monochrome monitor will work. Some hams go a step farther, and use the GATE function to crossband digipeat APRS data on HF with a complete packet system dedicated for that purpose alone. Others set up mobile APRS stations, so they can respond to changing events.

THE SKY'S THE LIMIT

As mentioned above, some SKYWARN participants use APRS to track the movement of storms. But you can have fun with it, too. Some enterprising hams have used their APRS/GPS systems for fox hunts, and cross country bicycle races. Some like to use it in combination with their local DX cluster. When a new DX station appears on the cluster, it can be plotted on the map along with the callsign. APRS packeteers have taken their portable packet systems with them on camping trips, and cross-country tours. Others have used their mobile systems to locate jammers, and then put his location on the map. You could conceivably put a GPS transmitter in your car the next time you have to park it at the airport for long time. If it turns up missing when you return, you just might be able to find it with APRS. The possibilities are almost limited only by your imagination. Who knows? You might even find a way to use APRS/GPS for an Easter egg hunt! Anybody want to know when Santa will arrive in the neighborhood? Try using APRS. You never know...

WHAT'S NEXT?

Obviously, there's a lot more that can be said about APRS, and many more uses than have been mentioned here. There are document files that come along with the software, and many more on the T.A.P.R. website and ham-related BBSs that can doubtless address aspects that have not been covered here. The capabilities of APRS are always being improved, and the latest upgrades are soon made available. So, if you're really interested in seeing a fascinating use for packet radio, get into APRS. Who knows what it may lead to?

This is true but the Tucker Test Equipment Branch has NOT closed. They just sold their amateur assets to Ham Radio Outlet. Personally I like HRO but it is scary, they are getting big and that can be a great thing or a really bad thing.

I am considering getting a second TNC. I currently have a KPC-3 amd like the way it works. I want to put together a tracker and wonder if the PicoPacket with internal GPS would be the way to go. Any feedback about the performance about the PicoPacket with or without internal GPS will be appreciated. Thanks in advance.

   aprssig@tapr.org said:

>Other than that, just tough it out and wait for beta 3!

Thanks to Steve's (wa4dsy) help, I now have the native java
applet viewer in OS/2 Warp 4 working perfectly for his site.
The netscapte beta still doesn't work, and that is what his
comment above refers to. Interestingly enough, the Netscape
beta 2 for OS/2 works just great at KL7J's site and for a
really nice implementation of Java you can look at ESPN's
SportZone...very impressive.

Steve has been a BIG help and watching live APRS data via
internet has a very eerie feel to it. I even saw myself on
the map, when I zoomed out far enough and early in the
evening, I forced a transmission of wx on hf with WinAPRS,
and watched the packet come into Steve's javaAPRS site! In
other words, I watched myself get updated on his system via
30m! Very strange, this mix of rf and computers.

I strongly recommend the Garmin GPS-45XL. Of course, we're a little biased
here in Kansas City since Garmin is headquartered here and they actively
support the APRS Group.....My opinion my not necessarily be valid...We have
had great successes with the Garmin units all around, though.

```

The receiver is the same the gps 38&40 IT is a MultiTrak8
THE GPS 38&40 have an 8088 microprocessor that reads the imput from the GPS
engine
If you want to spend all day at an attempt to pick apart everything then by
all means do so....(a life is needed here) The whole reason I sent the
article was to let every one know about them

The GPS 40 my friend purchased cost him a whole $125 (Can't Say Where:)
Only thing is an antennae from Garmin is around $100
GPS 31 TRKPAK is a good deal IN MY OPINION

I accept the diffrence in price for a completed sealed unit
not having to buy a GPS 20
BUILD or BUY antennae, connections, case, to all their own
as far as the 1pps timing output with a +/- 1msec I HAVE NO NEED OR USE!
if I need a calibration source that is what WWV & a LORAN-C CALIBRATION UNIT
ARE FOR!

```
I have downloaded the aprs program, loaded it, and configured it for my pk232.
I can see all of the packets fine, including ones that include lat/lon info.
I have it set to display all.  If I go to the station list, I have about 40
stations there now.  But, if I look at the map, the only icon I see is the
one for my own station that I manually located.  Is this the way it is
supposed to work, or is something wrong?  I thought I was supposed to see
icons for all the various, (or at least a significant number) of the
stations.  I am using default US map.

Try seting the TNC to MON 1
Got to dumb term in APRS. I forget not I think it is C then T and enter MON
1

If that resolves the problem change the TNC initialization file to include
MON1. APRS has not had this problem for a few years, seemed to have been
solved, did you tell APRS you were using a AEA tnc. Is your TNC in Command
mode and not HOST ??

I would say that the best GPS unit for APRS work is the TAPR GPS II. I do
not own one myself but come Monday I will be calling TAPR to order one. You
cannot beat the price, and it does not make you feel guilty when you tuck it
away in your car. I am a current owner of a Garmin GPS 40. The unit has a
very nice LCD with great graphics. The unit is quite reliable but better
suited for other purposes because of the LCD.

I don't think anyone is picking anything apart, Brian. There is a *big* difference between a 1 or 2 channel sequencing receiver and a 10 or 12 channel parallel one. The 38, 40 and 45 are fine for marine handheld use, hiking, and even casual APRS use (where the GPS can be supervised to make sure it hasn't turned itself off or needs resetting). The 31 is probably nice for using in a tracker where it can see the satellites a lot. We know it doesn't need anyone to keep pushing the power button.

But... the parallel tracking units similar to the Motorola Oncore black boxes (very reasonable), Trimbles, and the GPS 35 (and the units folks build from the 20 and 25 engines) are far superior when it comes to re-acquisition of signal after obscuration and stability of operation than any sequencer I have seen.

On the negative side- the ones I like don't have the cute display on 'em. But that's why I use the funware version of GMDAY. If you haven't seen GMDAY, try my web page:

Message-ID: <32A0551F.3@worldnet.att.net>
Rendered body type: text/plain

On the last two upgrades (the last one being 76 to 77e) I have had to re-configure the program on the first start up and save it. After that it starts as a registered program should. In past upgrades, the old CFIG file would work with the new upgrade.
I have changed the CFIG to 77d.apr.

Did I miss a step someplace along the way? I have looked thru the readme files and do not see anything about another change to the CFIG file since we changed it to 77d.

One of our Club members has a Davis Instruments Weather Wizard III that he want to get up on the air on APRS. It seems Davis wants $165 for the cable! Seens quite high since he really want need the Davis software if he's setting the device up on APRS.

Has anyone had any luck building their own cable. If so, can you share the pin outs, etc. Right now this weather system is just gathering dust!

P.S. for NOAN: Is it really 88+ degrees up in the Mid-West. That's what's being seen on your gated wx report. It's only 65 here in Florida!

Hi All,

On Sat, 30 Nov 1996 B.G. Gotshall wrote:

> On the last two upgrades I have had to re-configure the program ... and save it. After that it starts as a registered
> program should ... I have changed the CFIG to 77d.apr.

I think the reason it calls for a new CFIG file is because of what the update file actually is: 76to77e. All versions before 7.7d used a slightly different one. If, on the other hand, Bob had made a 77dto77e, the change wouldn't have been necessary, but I'm sure he thought more people would be upgrading from the older versions and it would be an unwarranted duplication of effort to make two versions of the upgrade.

Which brings up two other comments. With the "new" file "CFIG77d.xxx, when you call up the message digipath list with O(perations)-D(igis)-L(ist), the twelvth slot is taken up by one of the coordinate sets for the "hotkey" maps (ie: 1, 3, 7 and 9 keys) instead of that last digipath or a star for one that's unused.

Second, it seems the X(mit)-B(eacon) command is still disabled, which was noted in 77d.

BTW, I've found that my bad luck with the F9 (Win-Doze) key is a problem with MY computer and NOT APRS. 73

I have an IBM Thinkpad 760CD running PC DOS 7.0 & Windoze 3.11, 32MB ram.

I have WinAPRS 1.17. running through an AEA DSP-232 with the recent firmware upgrade.

APRS loads and appears to be running properly. The packets display in the small window below the map screen as they are received. I have logging turned on and can pull them down in the log displays.

However, the only call that is displayed on the maps is my own call. I have toggled every option. Even options that shouldn't have an effect, to no avail.

Is there something simple I'm missing or do I need to move to another operating system?

Thanks, Jeff WD4ET (new vanity call. Old WD4ETO)

Hi To all
A few weeks ago some one wrote how there system
(win 3.1 netscape 3.0) seemed to be Java scrpt enabled but the box
to make it java enabled was unchecked and grayed out. So the java enabled
box could not be checked.

I have the same problem. When I go to Bob's home page his dish ant flash showing me that I am java scrpt enabled. When I go to His aprs map Nothing that is supposed to happen happens.

I am running win 3.1, Netscape 3.0, on a 486 33mhz With 4 meg of memory.

MY question is. Why is the java enabled box in netscape grayed out?
Is it because of the fact that with 4meg ram I do not have enough mem to run Java

or is it because I am not running win 95?

Or some other reason I have not thought of yet.

Thank yoiu for your help. 73 de John

I don't know what processor the 760CD runs, but given it looks like at least a 486, and you have 32mb ram, I would HIGHLY recommend upgrading to Win95. You will find the program runs a LOT faster in its 32bit incarnation than under Win31.

Don't take this the wrong way, I am no shill for W95...the ONLY reason I run it on one of my machines is because of two programs: WinAPRS and Win95-SSTV. If your machine has a sound card, you can run color SSTV with it and get outstanding results with Win95 SSTV. I use it here all the time now and am taking my Pasokon board out of my other machine.

My own preference in OS is OS/2 Warp...running 4 here and dearly love it, but Win95 apps won't run on it. 73,

792. Thanks, Bob- for the "away message"

From: aprs@juno.com (ap rs)
Date: Sat, 30 Nov 1996 11:51:10 EST
To: aprssig@tapr.org
Message-ID: <19961130.115949.4326.2.aprs@juno.com>
Rendered body type: text/plain

I have been using the automatic response "away message" in version 77e and it has really cut down on wasted traffic to my station.

Now when I'm not downstairs in my basement shack and another APRSer sends me a one liner- he gets the "Sorry, I'm away from the terminal- try again later (auto response)" message. I still see his msgs to me, but he now knows not to waste time if he needs a timely response. Several users who have seen this have asked me how I got APRS to do that and I've told them to check out version 77E.

If you have Version 77E and you want to try this, just make your first message to REPLY and put your desired "away message" in the text. When someone sends you a one liner, he'll get your ACK and then your canned message.

Rendered body type: text/plain

David-

I have configured many trackers and use several myself, so I thought I'd answer your message here in the SIG. Sorry that it is so lengthy but there's a lot to say.

Many TNC manufaturers make nice mobile TNCs, including the KPC-3 you have. Most of them support some sort of stand alone GPS tracker mode as well. I have several of them. I've made suggestions to Kantronics as to improvements, but the responses I have received from them indicate that what we have is what we will continue to have.

Not so with Paccomm. The Company is very in tune with APRS and gives us way more support than any other I have seen.

In most stand alone trackers the GPS serial output is wired directly to the TNC's serial input. This makes it difficult to use when you ocassionaly want to run a PC in the car too. It can't be done without rewiring the setup. Even then, unless you want to add a second serial port to your PC, you must make or adapt an HSP (Hardware Serial Port) adapter to allow you to use both the TNC and the GPS together with your PC.

Then when you want to go to Tracker mode again, you have to rewire and issue the GPS command and power the TNC off and back on. The effort discourages flexible operation.

You asked about the Pico Packet. The Pico offers a several unique capabilities not found in any other TNC that makes it great for stand alone tracker use. It can be gotten with a second serial connection which is always connected to your GPS. The TNC is constantly receiving the GPS data, holding it and then sending it to the PC as requested.

Both DOS and WIN APRS support this mode by sending a special character to the TNC when a position report is desired. The TNC stops sending TNC data for a moment, substituting the desired GPS string. I have had perfect operation with intervals as short one second (the quickest APRS will request it). I use this fast operation when updating maps with GPS history.

Because the GPS is always connected to the second serial port, the Pico can do another unique trick. Since the Pico knows APRS is operating because of the periodic position requests sent to it, it can tell if you take the PC away or the PC battery dies or otherwise. After a user controllable period of having no requests from the PC, the Pico reconfigures itself right into a stand alone tracker. It then uses beacon path and interval settings that you have pre loaded . Your entry in the APRS P list even gets changed to a / prefix (indicating a tracker) from an @ symbol (which indicates that a computer is controlling the positions). Your Icon on everyone's map also changes color to that of a tracker. I think this is light gray, but can't remember.

I've tried trackers made from every TNC I can find and really believe that these features currently make the Pico the best arrangement for a mobile unit. Be sure to get the one with the second serial port.

To be fair, I have to blast them a little for not yet having remote sysop commands (even the PK12 from AEA has a limited way to do this. Very limited, though!) They (Paccomm) are always adding features, so I am expecting remote commands and automatic posit rate control based on speed to be forthcoming soon. Remember that Paccomm's main business is commercial TNCs and Vehicle location, so we Hams benefit from all the development they do for that market. This is a case where a person's hobby (Ham packet) became a business and now the business developments help give something back to the Hams (continued development).

One last thing- the Pico is also available with a built in GPS and external active antenna. Up until recentyl, the GPS did not send the $GPRMC sentence that gives speed and heading info. As an example of Paccomm's excellent user support they are going to be upgrading earlier versions of the GPS that lacked this and other sentences.

I'm sure you can get more details from gwyn@paccomm.com.

Gosh... it sounds like I work there. I don't ! I just feel that they currently give a level of user support unseen from other TNC manufacturers. My only other connection is that I gave Linda (Ms. Paccomm) a ride to the Amateur testing sessions at the Tampa Hamfest last

Saturday. That's right- soon she'll be a Ham too. So congratulate and
encourage her when you call to place your order   ;-)

73

Re: Jonathan's HSP problems on WinAPRS:

Don't know about your error, but remember that HSP is for a Hardware
Serial Port adapter (ie: the transistor switch in the docs, the adapter
from Paccomm, or the Pico Packet with built in HSP.)

You don't mention which HSP adapter you have, and if you don't have one
(which would mean you are using dual serial ports) , then you don't need
to be enabling HSP anyway.

I've never gotten HSP to work on WinAPRS at all so far. I have the Pico
with built in HSP as well as the more conventional adapter, and helped
him grasp the concept of HSP, but never was offered a chance to test it
before Mark released it. Not sure who did. Haven't heard anything as to
whether anyone is actually using it yet.

Yes, there are several TNC settings that have to be set like HEADERLN OFF,
I am working on documenting all of this

You have the old Serial DLL

If you are running Windows 3.1, I have not yet updated the 3.1 DLL, if you
are running Win95, just get the new DLL and all will be OK

No, WinAPRS does not allow changing of the background colors, but then
neither do very many Windows programs.

I did thourough testing with a Paccomm HSP cable, at present HSP mode does
NOT work under Windows 3.1 becuase I have not updated the 16 bit DLL yet.

Netscape does not do java under Windows 3.1. There is a beta version that
will, but it is full of bugs and will not run javAPRS. That means it is
coming though...either be patient and wait for Netscape to shake the bugs
out or go to Windows95

If you check the registration documentation you will find that there is a $7 fee for a change of callsign. Bob has already posted that info in a previous message to the sig. My club recently got a Vanity call and i need to send in the request and $. Bob's kids get the job of going through this process and issuing registration numbers so that Bob can concentrate on updates to APRS.

Anybody having trouble? I cannot get 77e to work with my 95 Box.. I have tried everything.

Here are the problems:

1. Won't read the config file.. EVEN if I save it from scratch using the ALT-S Save command. (vice using the 77d setup currently in place.)

2. The COM ports forget to work. I can't find the TNC.

Anybody else running into this problem?

806. Log File of Cross Country Trip

From: Steve Dimse <sdimse@bridge.net>
Date: Sat, 30 Nov 96 17:52:46 -0500
To: <aprssig@tapr.org>
Message-ID: <199611302252.RAA04721@newworld.bridge.net>
Rendered body type: text/plain

I had procrastinated long enough to finish work on the web page replaying my cross-country trip of a couple months ago. Since QST publiched the URL in the December issue, I decided I better get it done! It is now ready:

http://www.bridge.net/~sdimse/trip.html

The page includes a few pictures, and a javAPRS applet replaying the trip. The original log files were over 4 MB. I wrote a filtering program to remove all non-position report packets like messages, beacons, and IDs, and to remove duplicate packets, such as digipeated packets and reports with too great a frequency. The result is still large, 1 MB, but loads quicker into javAPRS. The program takes about 10 minutes to replay the entire trip, your speed will depend on your CPU and the speed of the network connection.

I have put a zipped version (210kb) of the data file on the TAPR server for those that would like to look at it...it will load into Mac/WinAPRS more quickly than javAPRS.

ftp://ftp.tapr.org/tapr/SIG/aprssig/files/javastuff/trip96.zip

If you want the unedited log file let me know, but I think most people that have asked for my log will get what they want out of the smaller file.

Hello,

I am kinda interested in this due to my travels to the U.K.  There is a
company that
offers a GPS map program with voice output.  It is interesting in that it
can handle
scanned in maps as it uses BMP format.  The full blown package is mucho
pounds
but the "lite" version sounds interesting.

Rendered body type: text/plain
```

Hi folks,

This is my first post to this list. My call is N4EEB and I'm in Ormond Beach, FL. I'm working on GPS tracking projects for the Civil Air Patrol here in Florida. I have a KPC3 running the ver 6.0 rom. I am going to invest in a professional grade mapping program soon, probably VISTA for search and rescue work. I am interested in getting your suggestions on a GPS receiver (no frills, no display) for use in an aircraft (120 its plus) and in a car, that would be a good match for the KPC3. I'd like to find one that does not require an initio string from the TNC prior to the unit sending NMEA 0183 ver 2.0 output. I'd also like one will all of the nmea 2.0 sentences. I was considering the Delorme Tripmate, but don't like the idea of the unit having to be powered up for 5 seconds and then dependant on an init string. Does anyone have any suggestions for me?

I would really like to use APRS, but from what I've seen (and I could be very wrong on this) the available maps do not support the level of precision needed to manage a serious SAR mission. I need the ability to toggle between sectional aeronautical charts, road maps, and topo maps. Vista is the only program that I have found that allows this. I also need to create overlays (such as the CAP grid system) for the maps. If anyone can comment on this too, I'd appreciate it.

Thanks in advance,

John Bayne N4EEB

>help give something back to the Hams.

Back when I was just toying with the idea of getting a GPS unit and I was relatively new to the SIG, I was very favorably impressed with the helpfulness, support and obvious love of concern Gwyn showed us in his posts and responsiveness to the needs, desires, wishes and (sometimes) whims of APRS users. I wrote him expressing this and said that I'd rarely seen such a level of hands-on person-to-person touch from ANY other amateur radio equipment manufacturer. Indeed, not from almost any business in any field.

They make an excellent product that is supported far and beyond that of one's normal expectations of a business. I said that this was a refreshing, delightful change from the norm of today's "Hey, you bought it. Now live with it and stop asking so many weird questions," attitude prevalent in today's make-a-buck, downsized, cold and impersonal business attitude.

In other words, this was the way I'd like to run my own business and how I wish everybody ran theirs. I'm in retail sales and recognize that such an attitude is the key to repeat customers. If you treat the customer with respect, offer them the knowledge they need, occasionally absorb a few bucks of profit to make sure they'll come back then they will.

Gwyn and Linda (and their employees), in my mind, exemplify the "American Dream" of making and growing a business while keeping a pulse on their customers' needs and throwing in that "extra something" that makes their business special, that makes them stand far and away ahead of the crowd.

BTW, I don't work for them either. Haven't been paid for the above (or otherwise renumerated.) I'm just one of their very satisfied customers.

And congratulations, Linda! I'm sure you know that you can connect to the QRZ website (www.qrz.com) and get your new call there several days before the ticket arrives in the mail. With the current FCC rules, as soon as you KNOW what your callsign is you can get on the air (you no longer need to physically posess the ticket!)

One of the things I do (on behalf of our ARRL Division Director) is send radiograms to new hams welcoming them to the hobby. So here's yours:

"WELCOME TO OUR GREAT FRATERNITY
SPEND TIME EXPLORING THE MANY

```
          EXCITING FACETS OF OUR HOBBY
          CONTACT YOUR LOCAL CLUB AND GET INVOLVED
          WE STAND READY TO ASSIST YOU  73"

     Unfortunately, I don't know your call.  When I send these
radiograms, I've been supplied with the daily FCC updates, thus
the ham delivering the radiogram is, in most cases, informing
the newbie of their callsign FOR THE FIRST TIME days before
the paperwork arrives from Gettysburg.  After all you've done
for us, I wish I could give you this information.  73

               Arte Booten <N2ZRC@gnn.com>
 (Packet Radio: N2ZRC@KB2VLX.#BRONX.NY.USA.NA)
  [Cruise Missile Coordinates: 40 52.69N / 073 54.06W]

... Sensors say there is nothing at those coordinates ...
```

Regarding what TNC/GPS to get, I will tell you that 2 weeks ago I ordered a PicoPacket. At $555 is was a difficult decision, however, David said it all below. I felt that given the flexibility, the features, the size, and Paccomm support it was the right decision. It has not arrived yet however :)

>David-
>

Jonathen,

I had the same problem this weekend when I went to use the HPS mode. The
problem
is that you need the latest .DLL files included with WinAPRS 1.1.7
update, the new
serial .DLL file enables the "setcontrollines" command to work with the
DTR line used for
the switch.

Thanks to Mark Sproul for the solution to this problem over the weekend.

Hope this helps.

Hi Ralph,
In reference to your message to Linda at Paccomm. Nice post!
It's good to see some hams can still offer a kind word and assistance to
others. Locally here there's so many problems. You can't hardly say
anything to someone in the ham community without causing a rift somewhere.
Makes me kinda wish I liked in your part of the country. I thinks it's
great to see an optomist on the sig.

ATTN Siggers..
Browsing some of the APRS WEB home pages, mentioned here on the sig, and notice a lack of referrels to the MIM or MIC-E APRs capabilites.
Clements WEB Page

"http://home.navisoft.com/agrelo/clement.htm"

is loaded with very interesting information, pictures and data on the Mim and Mic-E minature boards, and the new Ver 2.0 surface mounted even smaller minature TNC board.
May I suggest next time you HOME WEB PAGERS, upgrade your net info, you mentioned and give a small discription and the URL for the MIM/MIC-E products.
Could very will stir up more interest in APRS. A recent QST magazine even has a New Products article on the Mim chip.

P.S. for good black backgrounded maps, check out the DOS APRS VERSION OF APRS MAPS...Many outstanding maps of the USA areas.

TO ALL ON THE SIG:

I have accepted a new challenge (job) in Landstuhl Germany. The "RELAY" at my QTH, N39□37'01.5" / W104□45'41.2", on 145.79, will be off the air effective 12/9 until I return, and I will also un-subscribe before I leave. If I get a recripocal license I will try to initiate APRS in Germany from my QTH and vicinity . When I learn my new email address I will probably re-subscribe to the SIG, but unfortunately, none of the major players here in the states - Prodigy, AOL, Compuserve, Netcom, June, etc. - have points of presence(POP)connection in Germany! I will probably have email at work, but it probably will not be possible for me to subscribe to the SIG due to the volume of postings.

I am taking my APRS, 2m and HF gear with me if I get the license in time, so maybe you wil see me on 10.151 mhz. I requested info from ARRL on the 22nd but have had no answer yet on the license.

Art, KB1TX

Sorry, Carl-

Unless Baycom has come out with a TNC (I don't think so), you are out of luck right now. A Baycom is not a TNC- its only the Modem part of a TNC. The unit relies on software in your PC to do the rest of the job. It will not work with any version of APRS that is currently out here.

I recall a message from someone who (I think) mentioned that he was working on a program that uses APRS protocols and I think he mentioned a Baycom.

Go ahead and spring for a low cost regular TNC. You'll be able to stay on the map with APRS even when the computer is off.

Hi

I have been fooling around with both aprs75c and winaprs117. Is there a
document which outlines the feature differences between these packages and also
between javaaprs. From my testing I seem to like winaprs but aprs seems to have
different features. Also how can I get better maps. I have rand mcnally
streetfinder and it would be interesting to convert those maps for aprs use. I
will also be getting the delorme kit which includes the gps. any ideas to
improve map granularity would be appreciated.

Thanks

THe intention of Mac/WinAPRS is to have all of the funtionality of APRS, I feel that we do have MOST of them. We do not have support for meteor scator or space mode and are probably not going to implement them anytime soon.

We have a CD-ROM full of maps down to the street level and we have been making more maps for people if they are not on the CD-ROM.

These maps for WinAPRS are down to the street level, VERY detailed and some very large.

I am working on documentation for WinAPRS a lot lately and will be adding some feature comparison info mainly for people used to APRS so they can find the equivilent in WinAPRS, this wont be done for awhile yet.

Mark

I made a mistake in 77d which made it not save and load its config file properly. Hopefully I tried to fix that in 77e.

There seems to be lots of discussion, but if you start 77e from scratch (APRS77E/new) then all should be OK...

Some of the messages I have seen are confusing... If its still broke, tell me again... hi hi..

18. APRSdos compressed maps

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 2 Dec 1996 12:02:54 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.961202113726.2658A-100000@arctic>
Rendered body type: text/plain

For years, APRSdos maps could be saved in either a normal or compressed format. The advantage of the compressed format is that the file was about 50% as big and loaded twice as fast from disk. The disadvantage was that I had never finished fixing MAPFIX.exe to be able to TASK-OVERLAY and TASK-IMPORT directly from a compressed map. You had to uncompress it first.

Since those mapfix commands are very powerful, I just continuted to distribute maps in the normal format so that I wouldnt be hampered in my mapmaking. Also, since my distribution files are ZIPPED, you achieved the same compressiong and so nothing was gained during distribution..

BUT now, over 3 days of TNXgiving, I finally fixed MAPFIX29 to fully handle the compressed map format, so I spent days loading and re-saving all of my standard MAPS to the compressed format. You will see these maps and the new MAPFIX in a week or so... the normal user will see NOTHING new, all of this is transparent to the user.... unless he is a mapmaker...

The formats are very similar, the only thing I do is convert the two, 3/4 digit X,Y values for every point into THREE ASCII characters. This gives an 8 to 4 (including the CR on each line) reduction in the number of bytes per map point...

```
ORIGINAL FORMAT:  XXX,YYY   Could be any +/- integer value but mapmakers
                            were encouraged to keep them between 0 and 999
                            to keep the number of bytes to 3 or less

NEW FORMAT:       abc       Where:  a = 27+INT(XXX/16)   Rx = remainder
                                    b = 27+INT(YYY/8)    Ry = remainder
                                    c = 27+(8*Rx + Ry)
```

Notice that I add 27 to all three characters so that the results are all printable ascii characters. This process places limits on the original XXX,YYY values as follows:

```
             XXXX had to be between    0 and 3600
             YYYY had to be netween    0 and 1800
```

My documentation has been saying for years to keep your points between 0 and 2048 and 1024, but on looking in detail, the above values to almost 3600 and 1800 are permitted. MAPFIX29 draws the yellow limit box to these new limits. If your map does not fit entirely within the yellow box, MAPFIX will not let you compress it (shift-F3).   Thats why I had to load EVERY one of my 300 maps and use the CHANGE-ORIGIN command on many of them to rescale all the points to fit within the limits.

javAPRS is not intended as a competitor Mac/WinAPRS/dos. I would go nuts trying to match the feature sets in those programs, plus writing in Java provides some serious limitations, like no serial I/O! Interpreted Java is also very slow compared to compiled C used in Mac/WinAPRS and the compiled basic used in APRSdos.

Bob faces some serious limitations himself in programming APRSdos. Foremost is the dos limitations on 640k. Many of my MacAPRS maps are bigger than that, and all take more system memory when loaded (TSB [The Sproul Brothers] use triple buffering to speed up screen redraws for the maps). Java grabs 6 MBs on my system before it will even run a simple text applet. It is simply amazing how much Bob has been able to cram into APRSdos, espcially since, unlike TSB (or once upon a time myself), Bob is not a professional programmer. He would have been a great one! Unfortunately, bigger maps just aren't in the cards for APRSdos.

javAPRS likewise will never be able to open the large maps that Mac/WinAPRS support. It does, however, support a feature that allows it to display, on demand, a detailed street map of any area, obtained from the census bureau's TIGER map site. There are some (for now) serious limitations with this. See:

http://www.bridge/net/~sdimse/tiger.html

for a sample and discussion of the problems.

Everyone's ideal is to use a CD rom and have the maps draw as quickly with as much detail. The programming skill required to jam an entire US ATLAS on a CD ROM is enormous, and the companies that have done this have an enormous investment in their program. They won't just tell us how it's done so we can decode the data within our programs. There is one bright spot on the horizon though, one of the companies (Precision Mapping) does provide a programming kit that may be able to be incorporated into one or more of the APRS family of programs. If it is done, you can bet it will be announced on the SIG.

In any case, the final choice between WinAPRS and APRSdos comes down to a matter of taste. I've been doing APRS for more than 4 years now. I liked the program so much I actually bought a PC just to run it (quite a concession for a Mac guy). But being a Mac guy it drove me nuts not to be in a windowed environment. I also hated the black background. (A couple days ago someone rather crisply critisized TSB for the lack of this option, but it is entirely a matter of what you are used to. I had never considered drawing javAPRS maps on a black background until I released it with a light background typical of Mac/Windows programs and was promptly roasted by the legions of users who are accustomed to APRSdos.)
Mac/WinAPRS will eventually support almost all of what APRSdos does, but it is a matter of priorities. Remember that APRSdos has been around 5 years or so longer than WinAPRS, and be patient.

\>TASK-IMPORT directly from a compressed map. You had to uncompress it
\>first.
>

If you are planning to use maps with javAPRS, be sure to save a copy in uncompressed format, as javAPRS does not handle the compressed format. It may be twice as fast under APRSdos, but under java it would be slower. If enough of these maps are made I will update the program to handle them, but that will be a long time in the future, I have many other things to do the javAPRS and APRServe that are a much higher priority.

>

not
\>http://www.bridge/net/~sdimse/tiger.html
>
        (you had a / were a . belonged)

```
        dosAPRS came out in september 1992
        MacAPRS came out in 1994
        WinAPRS came out in early 96, so its 4 years, not 5
        X-APRS Hopefully will be out in 1997 (dont hold me to it)
```

xxxAPRS has evolved QUITE well over the last few years, Bob has done a wonderful job "marketing" the idea and getting it going in many aspects. Bob and us (The Sproul Brothers) have a very good relationship and work together on issues of protocol and compatibility which of course is paramount to our users. The future looks very good for all flavors, obviously as Steve pointed out, there will be some features that dos just cannot handle, but some laptops and other low-end machines just cant handle WinAPRS and some people just prefer dos. With the cooroperation that we have developed and the rather wonderful support we have from our followers things are looking very bright.

Mark

Rendered body type: text/plain

-- [From: Kevin Kelly * EMC.Ver #3.1] --

Greetings SIG

With all the excitement over the Delorme "Tripmate" (I got mine today) I
thought you may find it useful to know that most all PacComm tnc's have a
command called GPSITEXT. It allows up to 40 characters to be sent to the
attached GPS immediately after the packet controller is powered on. This
command holds the setup command string to be sent via the asynchronous
serial port to the attached GPS. There are no constraints placed on the
content to the field by the packet controller except that the length not
exceed 40 characters. The TNC does need to be set to the GPS mode.

I am using the PacComm aftermarket GPS eprom for the Heathkit HK-21 pocket
tnc.

Anybody out there know what the Init string for the tripmate is? Hopefully
it isn't over 40 characters.

73,
Kevin Kelly/N6QAB

Kevin wrote:
>Anybody out there know what the Init string for the tripmate is?

Kevin, here is a repost from WB1HBU

Hello,

The unit seems to lock on the satellites reasonably fast.   I downloaded
the New England area onto my laptop and the moving map display is
neat.

I should also mention that this unit does not have any controls on it
so it cannot be used for hiking, etc unless you tote another computer
along.

I hooked it up to a comm analyzer and played alittle. Communications
are 4800 baud using ASCII characters so far. The serial port does not

assert handshaking signals so hardware handshaking should not be used.

Power control appears to be the DTR line. Asserting DTR powers up the unit and it sends three NMEA messages (PRWIRID, GPRMC, and PRWIZCH) then keeps sending a non-NMEA formatted character string until it receives a $IIGPQ message with the character string. I was able to program a function key on the windows terminal to send the string and NMEA sentences poured out of the receiver.

NMEA messages begining with P are reserved for manufactuer's messages. RWI, I believe, is Rockwell International

The II prefix on the computer response message is the NMEA code for Intergrated Instrumentation. I cannot get a listing for what a GPQ message is. The "non-NMEA formatted message" may be a valid way for a device to hand off talking to another unit under NMEA. NMEA only allows one talker at a time.

Some of the NMEA sentences:

PRWIRID seems to contain number of channels, version number and software build date RID could be a nmemonic for Receiver ID

PRWIZCH twelve sets of what seems to be satellite PRN and a single digit code. Could be a channel status.

GPRMC, GPGSA, GPGGA, GPGSV   Standard NMEA fare.

I need to log the output as no doubt almanac and other messages are sent. I also have a Garmin 45 and may set it up so I can log the output of both units and do some comparisons.

Wayne, WA2N/5 mentioned to me:
>Here's a good place for GPS info, NMEA specs and shareware:
> ftp://sundae.triumf.ca/pub/peter/index.html
> Also, check out the newsgroup sci.geo.satellite-nav

The newsgroup currently has discussions on SA 4.0 and Tripmate.

I have used several Delorme products for years. Street Atlas 1.0 was the reason I bought a CDROM Drive. I had a few problems with the software, but it is a great product that keeps getting better.

Mark

My personal preference is for a black background. I like to leave the APRS
screen up all the time, and find that a black blackground is easier to
view. Grey would be little if any better than the current white screen.
Please don't implement this change just for me. I fully well understand
that you can not support all the requests that come into you, and
understand that you have to establish programming priorities.

I also now see that my first impression about your concern for potential
users and user of WinAprs was wrong. You evidently to concern yourself
with their suggestions and wants..

I will keep checking the features list, and who knows maybe one of these
days you can get caught up enough with the others features to make the
changing of screen colors an option in WinAprs, and I will then give it
another try..

Thanks
Don

Hello,

I would think that the program would take on the default background from
the color scheme so if you make the windows background black then
that would do it.  You would have to change some of the other
colors like text to white.

Actually, what I had to go through to do it in java was much more involved. Don't forget, the icons need to be different...for the white background many have a black border that disappears on a black background. Also many of the map colors do not show as well, and need to be adjusted. I would guess it would be even worse to do for Windows.

Personally, I like white, and I would rather see Keith and Mark work on something more important to the operation of the program.

37. RE: Tripmate init string?

From: Ron Henderson <crh@hpcvscrh.cv.hp.com>
Date: Tue, 03 Dec 1996 9:36:46 PST
To: aprssig@tapr.org
Message-ID: <199612031736.AA060004606@hpcvscrh.cv.hp.com>
Rendered body type: text/plain

>With all the excitement over the Delorme "Tripmate" (I got mine today) I
>
>Anybody out there know what the Init string for the tripmate is? Hopefully
>it isn't over 40 characters.

The simplified startup sequence is:

1. assert DTR - powers up unit.
2. Tripmate responds with it's poweron ID and then sends
   ASTRALcrlf
   ASTRALcrlf

Repeatedly until you respond with

ASTRALcrlf
ASTRALcrlf

After sending the ASTRAL's, you can change the Tripmate's assumed position, date and time by sending the PWRIINIT string:

```
/*
 * TripMate initialization String
                  DDMM.sss   DDDMM.sss                      HHMMSS DDMMYY
 *  $PRWIINIT,V,,,4435.911,N,12315.536,W,100.0,0.0,M,0.0,T,015931,281196
 */
```

The time is in utc. The N refers to north latitude, use S for south.
The W refers to west longitude. Use E for east

The *XX checksum can be added, but it's not necessary.

Ron WA7TAS (crh@cv.hp.com)

The SDK is more than just a collection of source code segments. It includes the necessary windows .dll's and sample code for Visual C/C++, Borland C/C++, and Visual Basic. This kit supports any TSIP compatible

Trimble sensor including the PC110 and the SV6 family. Complete documentation is included. I have the kit and am working on some of my own applications.
To be used with APRS it would require the various software authors to include some minimal code in their application to control the PC110 card. It is a very nice receiver and works well. It's nice to have GPS built into your laptop...

Hello
We have a serial connect from our computer and the Micrologic Admiral GPS
In the data string coming in some correct data is visible but there is alot of corruption in the strings. Our baud rate is correct, the data strings are corrupted in both the Windows Terminal Program and DOS APRS. Is there something we are setting incorrectly, our parity is non, our stop bit is 1, and our data bits are set to 8. Thank you for your help.

Well, I am somewhat confused. I have been reading this sig about the Tripmate. Some were saying something about an upgrade from Delorme, other's like this one.
I have had V2 of Street Atlas for over a year (registered), and V3 for almost a month (also registerd, not an upgrade) but haven't rec'd any kind of upgrade notice from them.
Do I understand the 'street' price (Computer City) is as cheap as Delorme?

thanks and 73 de Don KA0JLF

All you have to have is

        WinAPRS.exe
        serthunk.dll
        ser16dll.dll
and some MAPS in the map folder

You do have to install Win32S

>Personally, I like white, and I would rather see Keith and Mark work on
>something more important to the operation of the program.

I agree...there are MANY more important things to work on than fine tuning the cosmetics.

One (less important) color feature I could see being fixed is the winds aloft. Apparently in the Mac version the winds aloft change color with intensity (higher winds, different colors), but the WinAPRS version doesn't. Mine are always blue. Maybe I'm hallucinating, but as I recall when Keith was out here in Ames, his showed different colors by velocity and he was surprised that WinAPRS did not.

Again, this is WAY down on my priority list, but at least is connected to the rational display of differing information, as opposed to pure aesthetics.

While I am waiting for mine to arrive, I'm thinking about external power.
I'd like to leave the GPS turned on all the time in the car and not deal
with the INIT proceedures and lock-up delays at all. Obviously the batteries
won't stand for that and I'll need a 6 volt DC power source. Has anyone
checked out the wiring on the DB9 cable?  Are any of the wires in the cable
now wired for an external power source, or are there spares that may be
pressed into service for this purpose? External power would be a real plus
for this unit.

An earlier posting stated that external power could be applied to the
pin which corresponds to the RI signal. 6 Volts is the suggested voltage
to be applied. I don't have a description of which pin is which on the
9-pin connectors. I'm interested in finding out which is which as well.

>Where can I get one? Mail order? or Store?

Both Store and Mail order!

If you have a copy of Street Atlas you can call Delorme up and give the Serial Number off the CD. This route is

```
$125 plus $5 S&H.  Computer City has a sale of these
things for $129 plus Sales Tax.  The problem I have
is the one nearby in Saugus, Massachusetts does not
even have SA 4.0!  They do have the 3-D explorer.

I do not know Delorme's regular price.  I seen reports
of from $150 (Microcenter) to $199 (Tiger Software)
for a non-sale price.

Pin 9 on the DB-9 (RI) appears to only go to the center pin of the
power connector.  So a jumper is needed to go between the center pin
and the + pin.

Steve,

Some (i.e. at least one) of the maps distributed with javAPRS are (is?)
compressed. In particular, the MN-WI-MI map is compressed. When I update,
I have to copy back over it with my uncompressed copy of the map.

Message-ID: <v03007800aecab8cb4095@[199.1.11.151]>
Rendered body type: text/plain

We have posted an update for Tripmate on our Web page at:

http://www.delorme.com/support (Then -Tripmate Date & Time)

This update fixes problems with date and time identified and described in this newsgroup. Simply download the update and then run the executable. The Tripmate files will be updated automatically.

Although the time and date problem described below will happen each time you try initialize during December you can still use Tripmate without the update. In testing Monday morning I was able to aquire a GOOD fix within 2-3 minutes 7 times during 2 hours using the original software. Once one satellite is aquired the date and time will correct themselves. The problem will only occur during the month of December and only with the DeLorme Tripmate.

Please direct any questions to support@delorme.com

Thank you.

63. Scanner with APRS:

From: jud <judlynn@norfolk.infi.net>
Date: Wed, 4 Dec 1996 00:31:24 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <199612040531.AAA25646@mh004.infi.net>
Rendered body type: text/plain

When I track I use a Garmin GPS45XL, KPC-3, and the HTX-202. I transmit every 10 or 15 seconds when doing the roads for updating the maps. To receive the data I take along another KPC-3, HTX-202 and a HP200LX Palmtop. I use the Trimble for an antenna. This configuration works great.

I have an old 10 Channel Bearcat Scanner that I haven't used in a long time and I wondered if it could be put into service. I took it along yesterday and put it in place of the second HTX-202 to do the receiving. It worked flawlessly.

If you are short one radio to go tracking but have an old scanner laying around, give it a try.

Thanks to Eric's information and warning against applying 12 volts to the
GPS, I plan to build a 6 volt regulator board and install it in the battery
compartment of the GPS, thus allowing me to use any convenient voltage
source that I may have (12/24 volt) without worry. I plan on leaving the GPS
on all the time to avoid dealing with the init string and seek times
involved in power-up. This will make the unit much more flexible as far as
using it for moving map/APRS/tracker combinations.

Thanks Claude,

I fixed the schematic and uploaded the new version just now. I had to move the
relay to get the resistor and the LEDs to fit and missed fixing one line. This
was the kind of project where I drew the basic schematic and as i changed
things on the prototype board or even in the PC board I had to run to the
computer and update the drawing. Thanks again for finding my error. I hope
others will catch it or see this and get the correction.

73,

Bruce

70. 1:2,000,000 CD Maps

From: "Theodore A. Antanaitis" <tedant@pipeline.com>
Date: Wed, 04 Dec 1996 12:33:01 -0500
To: aprssig@tapr.org
Message-ID: <1.5.4.16.19961204173301.2b6f94f2@pop.pipeline.com>
Rendered body type: text/plain

```
In 1995 the USGS changed the format of the 1:2,000,000 Optional Format DLG
CDrom. The changes consisted of a reorganization of the data (DLG data is in
state by state files) AND DLG coordinates are in X and Y offsets (not
latitude and longitude as in previous CDroms). The new CDrom is identified
as Mastered: 7/95.

The unfortunate result was that the APRSdos map generating programs (e.g.,
MAKEMAP) could not process the data on the new CDrom. While many maps had
been already made from the 1:2,000,000 CDrom, demand for new maps continues
(e.g., waterway maps, county-line maps).

This is to announce that an *UPDATED* version of the QBASIC programs which
process the DLG data on the new CDrom have now been posted to the APRSSIG
library. The new files, NU2MG30.ZIP and NU2MG30.TXT, are in
/tapr/SIG/aprssig/files/maps/PCMaps. Users of previous versions (i.e.,
NU_2MEGA.BAS and NU_2MEGB.BAS) are specifically encouraged to update.

NU2MG30 prepares map files from the new CDrom in a simplified process where
the user specifies the state of interest, map center point (latitude and
longitude), and range. *NEW* in this version is an improved algorithm for
more accurate conversion of X-Y coordinates to Latitude-Longitude
equivalents. Maps of varying detail may be created (e.g., roads, waterways,
political boundaries). *NEW* in this version is the ability to create maps
with only a single catagory of feature (e.g., maps with only boundaries).

Map files prepared by NU2MG30 generally must be finished off through the use
of MAPFIX where labels can be created and the total number of points editted
to the APRSdos limit.

IF you are interested in generating specialty maps, custom maps, or already
have the new USGS CDrom, NU2MG30 may be what you need.

My thanks to those who answered my earlier posts regarding coordinate
convertions,
your help allowed me to complete this project.

I made just such a power supply (I used a 7808 regulator), it works
fine. The higher the voltage applied (up to 11.7), the better the
efficency, assuming a 12v (13.8) starting point.
I blew mine up before I knew better by testing it with 16 volts to
verify operation in an automotive environment. After replacing the Maxim
3.3 volt regulator inside the Tripmate, it works fine again.

Since the init string can be shortend from $IIGPQ,ASTRAL to ASTRAL, and
since the box repeatedly sends out ASTRAL's, I just short pins 2 and 3
together to auto-init the box after power on.

73. DLG Location System

From: Jim Olsen <JIM_OLSEN@novell.com>
Date: Wed, 04 Dec 1996 10:48:14 -0700
To: aprssig@tapr.org
Message-ID: <s2a55708.007@novell.com>
Rendered body type: text/plain

I have placed a screen shot and feature list of my GIS packet location
system onto the web. It can be viewed at:

http://www.ditell.com/~cavers/gispls.html

I thank the many people who responded with suggested features. I
have incorporated many of them including:

* Optional display of icon, name, AND/OR, track on a per station basis.
* Configureable colors for ALL features on map display.
* Conversion program to read optional format DLG files (1:100,000)
* Local station based configuring of icons for stations

I have a request to anyone who can help me. My area has VERY limited
APRS activity (Utah). Could someone from a very active area please
send me a raw text file of the APRS traffic in your area for a period of
time? This would help my development efforts greatly.

Thanks in advance,

Jim Olsen

Rendered body type: text/plain

```
Hello,
I this up on the satellite newsgroup and have not tried it yet.

<begin forward>

I have just discovered 1) this ng and 2) an item in the SA4 CD-ROM \util
directory, yet another tripmate.exe, which shows and interprets the Tripmate
output stream, shows SV locations, etc.

I have been able to interpret everything on the display except for the third
column in the left window.  The first two columns are satellite altitude and
azimuth; the third seems to be some measure of signal merit.  Can anyone
enlighten me, or point to a source of info on this nifty but apparently
unadvertised tool?

mdr

I don't re-call if I sent this suggestion before or not, the ability to
work in UTM and/or LAT/LON is something that Search and Rescue teams
usually need. It seems that ground searches rely on UTM while air
searchers use LAT/LON or even CAP grids. At least this is the way the
search team I was associated with works.

76. MIM Module Testing Update

From: Terrance Kealey <tkealey@mdc.com>
Date: Wed, 04 Dec 1996 14:37:49 -0600
To: aprssig@tapr.org
Message-ID: <s2a58d53.005@mdc.com>
Rendered body type: text/plain

```
This is a follow up to a previous posting I placed on the SIG about
MIM/GPS-20 problems I saw and my testing of the latest MIM controller.
The oddities I saw last week when testing it were due to my using an
old version of the configuration software. I originally purchased a MIM
1.04 and programmed it with the mic101.exe program. I needed
mic104d.exe to program the new MIM 1.06. I was able to download it
from the Clement Engineering web site.

 I programmed the MIM in MIC mode and the velocity problem is now
corrected.  When programmed in MIM mode, the position was
transmitted as programmed and not every few seconds as seen during
satellite acquisition with the GPS-20. I have not restested all
configurations, only the ones that I had previous problems with. A neat
feature added to this version of the MIM is the ability to set which GPS
message to transmit. For example if you want to use the MIM for a
balloon launch and wanted altitude transmitted, the GPGGA messge
could be specified.
```

In addition to the configuration software on Clement web site, there is
also a complete operator#s manual that can be downloaded. Both of
these may be of interest to the people who will be beta testing the MIC
Encoder and to anyone who wants to determine if the MIM is a TNC
option that they want to use.

The Clement Engineering web page is at -
http://home.navisoft.com/agrelo/clement.htm

One last comment for Bob (WB4APR). When using the MIC Encoder
with the GPS-20, I think you might want to consider putting an indicator
on the front panel to let the user know that the GPS data is valid. I have
seen other stand-alone trackers the area drive around for 30 minutes
outputting null position data and not knowing it. I think the 1PPS output
would work for this and would give the user feedback that GPS portion
(receiver and antenna) of the MIC Encoder was working properly.
Maybe this could be a future upgrade if the design is too far along.

Hopefully the above information is useful to everyone.

Terry, KI0BF

77. Garmin GPS II

N2XDD asked

> Anyone familiar w/ the Garmin GPS II?
> Does it have a removable antennae?
> NMEA output?

The GPS-II is essentially a GPS-45XL laid on its side.
The antenna is removable. It does have NMEA output, Garmin's priopreitary
I/O, and RTCM inputs. The "on its side" "portrait vs landscape" can be
toggled. The only other funtional change is the addition of map zoom in/out
buttons.

Hello,

I would be careful as the caps on the input of the Maxim DC-DC converter are 10 volts. I consider 8 to be on the upper limit of the voltage. While the Maxim chip could stand 11.7 I doubt the caps would for long. Of course it looks like there may be 2 diode drops (diode and transistor switch) but I would still not go too much above 8 volts.

There are at least two people in the San Diego area who would like to use WAPRS but don't because of the background color. Most of the others here that use it have complained about the way the maps look. The problem is that when I make my maps I choose the colors according to the contrast with the black background. When the map is displayed on a white background the contrast is reversed making the less prominent features stand out and the important features wash out. I also would like to see the choice of a black or dark grey background.

Sounds like you need to budlist him. I did months ago. On the Mac, all
message to you and beacons are spoken aloud. Besides having no info I
care about, the format of his message results i being pronounced by
computer as a 30 secong long run-together sentence. Very annoying.
Setting the budlist cures all of this.

However, when I print out a copy of my map on paper if the background
were white, WOW what a lot of black ink/toner would be wasted!
So as long as we do not have a choice I hope it remains white.

To: aprssig@tapr.org
Message-ID: <32A63A95.75DF@ix.netcom.com>
Rendered body type: text/plain

For the sake of the finals in my transceiver and for a little sanity
(very little) here on the left Coast I have, for the first time in 11
years reluctantly put callsigns in my TNC's "SUPCALLS". Until today I
have been GATE'ing & DIGIpeating ALL APRS stations on 10.149.30 mark FSK
and on 145.010. In future, ANY station using a path thats over 12" long
............(Hi!) Seriously, one or two "WIDE" or "GATE" statements is
enough! I will be adding or removing calls in the "SUPCALLS" according
to the "DIGIPEATERS USED" list on a daily basis. As I'm typing this I
see one local VHF'er listing 7 wide digipeaters buy their callsigns, and
the last statement is "WIDE"... Gimme a break!

I have just posted on my web page a complete list of MIM Module
and MIC-Encoder firmware revisions. This may be of interest to those
who have purchased units in the past and are wondering if an upgrade
is necessary. The file is in Microsoft Word 6.0 format and zipped
for download.

```
By the way, for those MIC-Encoder beta testers, the beta test firmware
is now complete ("MIC104e") and will leave my office shortly.

One last reminder for the Seattle area SIGsters: I'll be giving an APRS
demo at the Boeing Amateur Radio Club (BARC) monthly meeting on Saturday,
December 7th, at about 10:00 am, at their mtg place in Kent. I understand
there will be signs posted at key locations, and talk-in will be on
145.33 repeater. This is in the vicinity of 212th and Valley Hwy. Hope to
see you all there.

Will those of you who have APRS please have your stations OTA by 9:00.
Would like to see N7RIG mobile, if available, along with others, to show
some mobile capabilities.

95. yet another java TNC server

From: Alan Crosswell <alan@watsun.cc.columbia.edu>
Date: Thu, 5 Dec 96 0:20:08 EST

To: aprssig@tapr.org
Message-ID: <CMM.0.90.4.849763208.alan@manila.cc.columbia.edu>
Rendered body type: text/plain

http://www.cloud9.net/~alan/ham/aprs/aprsmon.tgz is a TNC monitor for
javAPRS that runs under Linux (you know, the OS Intel hardware was
meant for:-) It has configurable amount of packet backlog to save up
but no smarts to reduce the data at this point. Runs under Linux
2.0.0 with the Kernel-based ax.25 stack and axutils-2.0.12.

I'm currently using it with a TINY-2 in KISS mode and have tested it
with a BAYPAC with the recently-released Linux Baycom driver as well.
Since the kernel is doing the AX.25 low-level interface and uniformly
making it all look like KISS frames, even a lowly Baypac can look like
a "real" TNC.

I do not yet have an Internet-connected host running it (unless you
happen to telnet to my home machine right now while I'm typing
this:-).

It works great as a standalone means of monitoring the APRS net without
having to reboot the durn machine into DOS or Windoze. I run appletviewer,
which is part of the Java development kit (jdk) and have this param
in my html file:
<PARAM name = "dataFile1" value = "netc:14579:localhost">

It works with Netscape too, but appletviewer is a lot zippier.

Kudos to Steve for making that lousy excuse for a programming language
jump through hoops. Too bad he won't let us read his code and learn
from him:-(

aprsmon is free software (source code) under the usual Gnu public
license terms and is based in part on source code from axutils-2.0.12.

I've also included a modified version of axutils' "beacon" which is
what is causing N2YGK-8 to beacon every 120 minutes or so.

Still need to work on digipeating -- probably just a few mods to
axdigi.

73 de Alan N2YGK

PS: TIGER/Line 1995 CD ROMs started shipping a couple of months ago.
    They now use WGS-84 datum instead of NAD-27 so one less thing to
    have to get around to on tig2aprs:-) Unfortunately, my local
    library has not yet received them (more likely they are in the
    huge stack of received but not yet cataloged books....)
PPS: Got change of a $20? [New Columbia U greeting]

Message-ID: <CMM.0.90.4.849771765.alan@manila.cc.columbia.edu>
Rendered body type: text/plain

Just some local stuff using two or three dos maps generated from tiger files -- and with a nice white background:-) Shows N2AMP driving around the county with his MIM (with a real good demo of SA jumpiness:-) and N1HF just passin' through I guess (no doubt having a QSO on the low bands). Seems like Arte might have moved his car across the street, too (or just more SA jump).

http://www.cloud9.net/~alan/ham/aprs/java

I had to edit my valid APRSdos maps for javAPRS to successfully parse them. Just something to look out for. Namely, floating point map ranges break javAPRS as do multiline comments before the initial 0,0.

My kludge for multi-line labels to circumvent APRSdos 12 char limit shows up quite clearly too, just like in WinAPRS.

I'll be needing some extra Java at work tomorrow (er, this) morning.

Paper maps, which I'm sure you've read before, are on white paper! Why not use the colors that Rand-McNally have been using for years? If a person can see the fetures of the program for the color of the background...... how does that go? Can't see the forest for the trees?

Don't take offense, this is just an opinion.

Hi Bob, and the SIG,

     A few days ago I commented that it seemed like the X(mit) B(eacon) command in
7.7e was still broken.  I realized (after all, it was only staring me in the face)
that this had been changed to X S(tatus) so as to remain consistent with the move
of the former Alt-B command to the I(nput) M(y) submenu.  I had been pressing X B
so many times and wondering why I wasn't transmitting that I was about to rebuild
my TNC to radio cable!  This wouldn't have been so much of a problem if I'd had a
bulletin though, as that's what the X B command does now (this was formerly X(mit)
b(U)lletin.)  To this end I publicly, for all to see, humbly submit to the SIG my
heartfelt, apologetic DUUUUUUUUUUUUUUUUUUUUUUUUUUUUUUUUUUUUUUUUUUUHHHHHHHHHHHHHH! 73

Budlisting doesn't solve the problem of using up precious HF bandwidth. He
is transmitting on HF for no purpose whatever. No one needs to know
ANYTHING he is transmitting on HF.

Aren't there any locals who know about HF that can call him on the phone
and ask him to stop? 73,

Yesterday I got my xyl's machine upgraded and put w95 on it. Using the
built in web browser, which I think is Internet Explorer v 3.01, I am
having great success going to wa4dsy et al.

One problem, both apr and dsy sites refer to opening the Java Console to
see incoming data or station lists. I can't find the procedure anywhere to
open a java console for the internet explorer. Can anyone help me with
this?

The java console works fine under Netscape/2 and the Warp4 applet  viewer
under OS/2, but W95 is a mystery to me. TIA

You didn't say, but I'm assuming you are not using a laptop or other PC in
the car, right?

I update maps a lot using GPS too. When I track roads and have the laptop,
I set the posrate to 1 second and leave the transmit rate at the default
180 seconds.  The built in HSP of the pico can handle 1 second screen
updates and have not a single glitch. My old hardware HSP usually screwed
up every other position or APRS received posit (or got HSP timeout)
whenever the position rate was less than 5 seconds or so.

I just re read the above and need to clarify:  NO I am NOT transmitting
every 1 second, only screen updating.

I too saw the GPS II (on Garmin's web page)and started salivating.  I went
to HRO, which carries Garmin GPS units, they had them listed, at $249.00,
but not yet in stock.  I went to Popular Outfitters (Good Phoenix based
camping/sporting goods store).  They had the flyer on them, but none on
display.  The manager saw the flyer in my hand and mentioned that the GPS II
sure was a neat unit, but Garmin had recalled all of Popular's stock, due to
a bug in the firmware.

Here are some spec's:

250 Waypoints, nearest 9 automatic
106 Map Datums
Coodinates of LAT/LON, UTM/UPS, plus 7 grids (including maidenhead)
NMEA 183 and RS-232 DGPS correction
2.32" x 5" x 1.62"
External antenna w/standard BNC connector
Power by 4 AA batteries or 10-36 volts DC @ .75 watts

Hope that helps.

73,

Mark KC7BXS

The FOotbal run tomorrow from Annapolis to Philadelphia starting at noon
will have 2 vans.  Both will have 1 watt APRS stations and 40 watt voice
radios with Mic Encoders.  They will both use the path of
RELAY,WIDE,WIDE.  If there are any local HAMS that wanted to shadow them
when they are far from a digipeater to provide a mobile
"RELAY" would be helpful.

They will pass through Baltimre about afternooon rush hour and proceed up
route 1 crossing into PA about 2200.  Arrive Philly about 0700 the next
morning.  Nobody much cares past midnight except for local comms between
footbal and the command post at Oxford PA...

>them to him... I've got to discuss this with some of the other locals first.

Perhaps we all could send them to him via PBBS. He'd probably be there all day downloading them at 1200 baud, seeing that QRM and channel overloading can work both ways ;-{(

Seriously, BUDListing somebody has to be considered as a "last resort." Doing so doesn't reduce the QRM on 30M as he's probably going to be unaware that he's no longer being ECHOed or DIGI'd. Also, let's not forget what happened to Bill a few weeks ago when HE was BUDListed. Doc (at least going by Richard's description) may not even CARE if some stations do so.

BTW, according to my 1994 callbook, W1ON is listed as Arthur P. Peardon, 139 Buckskin Path, Centerville MA 02632. Not that I'm suggesting any course of action by having this address, of course. 73

119. Garmin 20 problem

From: Clifford Buttschardt <cbuttsch@slonet.org>
Date: Thu, 5 Dec 1996 17:15:57 -0800 (PST)
To: aprssig@tapr.org, mic-e@tapr.org
Message-ID: <Pine.GSO.3.95.961205170916.6174A-100000@oso.slonet.org>
Rendered body type: text/plain

My Garmin 20 obtained from TAPR works well when in continuous operation from an external power supply BUT on occasion simply refuses to display data. The serial data stream is there, but the device refuses to update. Simply breaking the 5 volt power which allows the unit to internally reset will again produce valid fix information for periods as long as a week.
   This one is going to be rather hard to fix, but have any other members found this situation occuring? At least this is a start. Cliff K7RR

```
Steve writes:

> I note that people are using beacons which transmit from an
> unattended situation. Do the FCC regulations now allow one
> to transmit in this manner, without a station operator present
> nor a supervisory remote control link?

Yes, and the answer is:

  97.221 Automatically controlled digital station.

    (b) A station may be automatically controlled while
    transmitting a RTTY or data emission on the 6m or shorter
    wavelength bands, and on... [numerous HF segments].

and:

  97.109 Station control.

    (d) When a station is being automatically controlled, the
    control operator need not be at the control point.
    ...[qualified station types, which includes the above]

So we're covered.

124. Help needed with getting on APRS with PICO Packet

From: WagWagnon@aol.com
Date: Thu, 5 Dec 1996 22:29:14 -0500
To: aprssig@tapr.org
Message-ID: <961205222913_1952637020@emout17.mail.aol.com>
Rendered body type: text/plain

```
Hi,

I am have a PICO Packet with an internal GPS which I am running on APRS using
a MFJ Packet Tranceiver.

I am not able to get it set up right to acknowledge the GPS. When I start up
the APRS program (ver 7.7e) it asks which port I am going to use. I then
assign it to COM 1. It then asks me if I am going to use another port and
this is where I am lost. If I answer "yes" then the system later on hangs up
on me when I set up the GPS. If I answer "No" then when I go to set up the
GPS, it says that I do not have any port available to install the GPS. The
GPS is internal and it supplies all the data on one port, so I am told.  I
have contacted PACOMM and they say that they are not that familiar with the
APRS program.

If anyone is using this PICO Packet with Internal GPS, I would greatly
appreciate it if you could furnish me the information on setting up the unit
with APRS.

Thanks,

Wag.... W9IUP

Tell it you have only 1 port (usually Com1), and that the TNC is a Pico.

You must have a GPS registration number for APRS from WB4APR. (I think you are still waiting on that - I sent him a message for ya)

Once you have done this, go to the terminal window screen (O C T) and set the command LGE $05 This will set the Pico up to talk to APRS. There are a few other things, but these are the ones that cause the most problems.

128. Flight of the EAGLE

From: Kevin Heyboer <kheyboer@pinegov.co.pinellas.fl.us>
Date: Fri, 06 Dec 1996 07:27:34 -0500
To: aprssig@tapr.org
Cc: aprs-fl@tapr.org
Message-ID: <32A81135.1EE3@co.pinellas.fl.us>
Rendered body type: text/plain

Greetings!

For those who received the flight data from EAGLE 4 last night, here are the answers to your questions:

Eagle is the radio codename for the aircraft used by the Pinellas
County Sheriff's Office in Clearwater, Florida. Here is the
information on last night's mission:

1. Purpose: To test the use of a stand alone GPS tracker on APRS inside
a fast moving helicopter for the upcoming special event "Ride with the
Stars" on Saturday, December 7, 1996.

2. Equipment: Magellan XL GPS, KPC-3 TNC in GPS MODE, Motorola MT-1000
portable radio, 7 amp hour gel cell battery, and suction cup mount for
GPS antenna.

3. Aircraft: 1992 French made ASTAR jet helicopter, FAA ID N53SD
equipped with a 50,000 candlepower NightSun spotlight and Forward
Looking Infrared (FLIR) sensor.

```
4.  The crew:  Pilot:  Deputy Charles Tarrou
               Co-Pilot/Observer: Deputy Joseph Lawson
               Airborne Tracking Specialist:  Det. Kevin Heyboer KD4UYR
    Note:  Both Dep Tarrou and Dep Lawson are the combat veterans who
           were shot at during the recent riots in St. Petersburg.
```

5. The mission: GPS tracker test during routine patrol flight of the
Eagle.

6. The results: Quite impressive, actually.

7. Problems encountered:
     a. GPS took about 15 minutes to sync up on initial installation on
the ground.
     b. GPS lost satellite lock during high speed tight orbital turns
during a search for a prowler and did not sync up for several minutes
thereafter.
     c. Gel cell died after about 1 hour use.

Anyone interesting in obtaining a log of the flight may do so by sending
me a PRIVATE e-mail and I will send it as an attachment.

Watch for SANTA to travel from PIE to the very southern tip of Pinellas
County on Saturday, December 7, 1996 at some time between 0900 and 1000
Eastern Standard Time.

You can obtain more information on the Pinellas County Sheriff's Office
and Everett S. Rice, Sheriff of Pinellas County, at:

http://www.co.pinellas.fl/sheriff/index.html

I'm a registered user of Delorme products but did not get an upgrade
flier prior to reading about it on this sig. I called them and got the
BE32 code for upgrade, sent them a check on 11/25/96 and recieved the
package on 12/5/96. So far I'm impressed with the service and the unit.
Its my fourth GPS, each one has been better and cheaper. There's no such
thing as too many toys.

Jim,

There's zilch local APRS activity here, but I monitor 10.151 LSB packet
and
digi it out to the local node.   If you can get on there, you'll have
good
stuff coming in all day long from around the country.

Good Luck.

Rendered body type: text/plain

```
We're working on the W1ON-3 problem locally by trying to make contact though
lots of means currently.

 W1ON is a recently re-issued vanity callsign issued to a club, I believe,
at least there was another call on the station until recently. W1ON is a
club call with KB1JY as the trustee. However, I believe W1EO is the guy
responsible for the APRS stuff there.

 I recommend tactful messages by regular packet to w1eo@w1on.ma by packet
might help.

Well I just got mine yesterday. It installed fine on the home computer but
was touch and go on my laptop. Delorme says use a minimum of a 486DX with 8
meg memory and 10 meg swapfile. I've got it running (S L O W L Y) on a
386SX25 running Win 3.1 with 4 meg ram, corrupt swapfile, broken trackball
and a pretty full compressed 80 meg harddrive. Its amazing it works at all.
Next comes wiring up a regulator for the GPS. The 386 package takes forever
to boot and initialize, so I plan on leaving the whole works powered up most
of the time..

IN ADDITION to those few problems listed by Kevin: The following was noted - We projected the DOSAPRS version through an overhead mounted video projector onto a large screen at our regular monthly ARES meeting so that it wa easily seen by all present. The helicopter symbol came up as expected and we following it on the map was very easy..however When I did a REPLAY on my home WinAPRS setup..the helicopter was only seen as a DOT..Not a helicopter as expected..since this is a stand alone tracker setup on the copter, is there a way for something to be put into the beacon strings which works for both the DOS and WIN versions so that the helicopter symbol is seen by all no matter which operating system version one is using??

TNX,

Watch for SANTA to travel from PIE to the very southern tip of Pinellas County on Saturday, December 7, 1996 at some time between 0900 and 1000 Eastern Standard Time. (TOMMORROW)

137. Help w/ registration of APRS

From: sjking@juno.com (Steven J King)
Date: Fri, 6 Dec 1996 09:39:53 EST
To: bruninga@ncsa.navy.mil
Cc: aprssig@tapr.org
Message-ID: <19961206.133058.6583.0.SJKing@juno.com>
Rendered body type: text/plain

I'm not sure which is the correct address to ask this question so please forgive me if I am wrong.

Does the $30 registration fee cover all future releases of the DOS and Windows 3.1 version of APRS, or does it cover only the current version (7.7e)? I presume the $24 and $26 club rates for 10+ and 5+ users, respectively, is in addition to the $30 base price? Is that price the "initial order" or the "separate order" rate? When requesting the club rates, is the registration based on the club callsign or any one callsign or each of the callsigns, i.e., is there only one V# issued for the club rate or is each person issued their own V#?

Thank you for your help.

Steve KC6WCH

145. Re: [APRSSIG:6914] Tripmate GPS unit

From: Bill Kearns <billk@inland.net>
Date: Fri, 6 Dec 1996 15:22:58 -0800
To: aprssig@tapr.org
Message-ID: <199612062322.PAA09341@ns1.inland.net>
Rendered body type: text/plain

Hello,

After reading about the Tripmate so much on the SIG. I finally broke down and bought the Delorme Tripmate at Computer City for $129.95. Seems to be a stout little unit....now to hook it up to my PacComm (mobile tracker). What we need here on this SIG are a couple of on-going manuals for newbies (and everyone else) to refer to when assembling their mobile trackers. I'll stick my neck out and get this one started and I'd sure appreciate it if some of you WIZZ_BANGS out there would critique my notes and re-edit and re-post this manual giving me (and everyone else) advice and corrections where needed.

PacComm Pinout:
Pin #1 Mike Audio
Pin #2 Ground
Pin #3 PTT
Pin #4 Recieve Audio
Pin #5 Squelch Input

TripMate Pinout:
Pin #1   nc

```
Pin #2       RX --Black wire
Pin #3       TX --Brown wire
Pin #4       DTR--Red wire, assert to turn on
Pin #5       GND--Orange wire, connects to GND of power
Pin #6       nc
Pin #7       nc
Pin #8       nc
Pin #9       RI --Yellow wire--goes to center pin of Power Connector.
                (Special thnx to Gould Smith WA4SXM for the above pinout)
```

```
Okay now for the interface. As I see it...
Tripmate- Pin #3 goes to PacComm  Pin #4  (tx to receive audio)
PacComm-- Pin #1 goes to Tripmate Pin #2  (mic audio to rx)
Tripmate  Pin #5 goes to PacComm  Pin #2  (ground to ground)
```

Is this how you see it? Assuming im using a separate power source for the Tripmate these are the only connections between the two units. (correct?)

```
Now for the software commands:  (TNC baud rate must be set to 4800)
                                (Commands listed below are variable..)

mycall        callsign-9
btext         "AnyHAM's Mobile Tracker"
location      every 1
beacon every  60
unproto       aprs via wide,wide
gps           on
```

I need the "ini" command for the tripmate and the TNC command to load it in.
Also FYI, DeLorme sells a Tripmate power adapter kit for about 39 dollars...
....goes into a cigarette lighter or your laptop. 1-800-452-5931.

Ps. In case anyone wants to call the above number and order a TripMate for $125.00 plus 5 shipping... here is the number off the back of my "Street Atlas USA" ver 4.0   700709   I don't know how many of you can order a tripmate using that number but at least one of you will. (the first one!) remember...these guys manning the phones are more than likely working on a commission and would love to have your business!!!   Good Luck!!

```

I don't think you want to connect your Tripmate to the Radio port
of the TNC. You want the gps or terminal port.

  I don't know what your symtoms are, but the 232 is notorious for the
screw holding down the voltage regulator coming loose from heat cycling.
That regulator gets very warm.

 Hope to do so this weekend.  I see no problems at all in doing so. Just
have the KPC-3 send the ASTRAL string to the Tripmate using the GPS INIT
string command of the KPC-3.

159. RE:Tripmate GPS unit

From: Bill Kearns <billk@inland.net>
Date: Fri, 6 Dec 1996 17:41:00 -0800
To: aprssig@tapr.org
Message-ID: <199612070141.RAA13626@ns1.inland.net>
Rendered body type: text/plain

Hello, this is the revised edition of the manual....any more mistakes?? feel free to criticize or edit...just repost it....

After reading about the Tripmate so much on the SIG. I finally broke down and bought the Delorme Tripmate at Computer City for $129.95. Seems to be a stout little unit....now to hook it up to my PacComm (mobile tracker). What we need here on this SIG are a couple of on-going manuals for newbies (and everyone else) to refer to when assembling their mobile trackers. I'll stick my neck out and get this one started and I'd sure appreciate it if some of you WIZZ_BANGS out there would critique my notes and re-edit and re-post this manual giving me (and everyone else) advice and corrections where needed.

PacComm DB-9 Connecter Pinout:
Pin #1 audio
Pin #2 xcd (squelch)
Pin #3 PTT
Pin #4 nc
Pin #5 RX audio
Pin #6 GND
Pin #7 +12v
Pin #8 nc
Pin #9 GND

TripMate Pinout:
Pin #1   nc
Pin #2   RX --Black wire
Pin #3   TX --Brown wire
Pin #4   DTR--Red wire, assert to turn on
Pin #5   GND--Orange wire, connects to GND of power
Pin #6   nc
Pin #7   nc
Pin #8   nc
Pin #9   RI --Yellow wire--goes to center pin of Power Connector.
(Special thnx to Gould Smith WA4SXM for the above pinout)

Okay now for the interface. As I see it...
Tripmate- Pin #3 goes to PacComm Pin #5 (tx to receive audio)
PacComm-- Pin #1 goes to Tripmate Pin #2 (mic audio to rx)
Tripmate Pin #5 goes to PacComm Pin #6 (ground to ground)

Is this how you see it? Assuming im using a separate power source for the Tripmate these are the only connections between the two units. (correct?)

Now for the software commands: (TNC baud rate must be set to 4800)
(Commands listed below are variable..)

```
mycall        callsign-9
btext         "AnyHAM's Mobile Tracker"
location      every 1
beacon every  60
unproto       aprs via wide,wide
gps           on
```

I need the "ini" command for the tripmate and the TNC command to load it in.
Also FYI, DeLorme sells a Tripmate power adapter kit for about 39 dollars...
....goes into a cigarette lighter or your laptop. 1-800-452-5931.

Ps. In case anyone wants to call the above number and order a TripMate for
$125.00 plus 5 shipping... here is the number off the back of my "Street
Atlas USA" ver 4.0   700709   I don't know how many of you can order a
tripmate using that number but at least one of you will. (the first one!)
remember...these guys manning the phones are more than likely working on
a commission and would love to have your business!!!   Good Luck!!

```
                Bill Kearns WB6JAR
                   909-678-6228

                      /// \\\
                    ///// \\\\\
                    (  0   0  )

WinAPRS and MacAPRS will have full support for the Tripmate in the next
release. (The code is already done and tested)
(This was announced a couple days before thanksgiving, but, due to all
of the other things going on at that time, you probably missed it).

I got a chance to play with one while in Texas visiting my dad and wrote
the code to support it..   I really liked the unit and promptly ordered
my one.. I just got my early this week.

> Who makes the board...... etc...

The board is made by Rockwell

This can be determined by the use of the $PRWxxx stuff in the NMEA data..

In 'NMEA-SPEAK', data sentences that start with $P are PROPRITARY
and the following two letters indicate the manufacturer.

i.e. $PRWxxx = ROCKWELL

Keith Sproul

```

```

161. Re: [APRSSIG:7028] Re: Tripmate GPS unit

From: Robert Winingham <kc5ejk@onramp.net>
Date: Fri, 6 Dec 1996 20:26:03 -0600

To: aprssig@tapr.org
Message-ID: <v03007800aece805fd623@[199.1.11.146]>
Rendered body type: text/plain

```
TripMate Pinout:
Pin #1  nc
Pin #2  RX --Black wire     (jump pin 2 to pin 3)
Pin #3  TX --Brown wire     (this wire to TNC)
Pin #4  DTR--Red wire, assert to turn on
Pin #5  GND--Orange wire, connects to GND of power
                            (and RS-232 Ground to TNC)
```

Jump and Tripmate pin-2 to Tripmate pin-3 and forget any init
strings. OK to leave connected after the Tripmate see's its own
output and auto-starts.

Run the Tripmate pin-3 (TX) to the TNC or APRS computer RS-232 input pin.
(no connection to TNC or APRS computer RS-232 output pin.)

Connect Tripmate pin-5 (gnd) to TNC or APRS computer RS-232 ground pin.

Connect Tripmate pin-4 (DTR) to TNC or APRS computer RS-232 DTR pin or
a RS-232 output that comes on when the TNC or computer is on.

Note to Bill, the RADIO I/O ports are your problem
and not part of the Tripmate manual.
Don't make ANY tripmate connections to the TNC RADIO port.
I have now seen two posting that are wrong !

I have the Tripmate and SA4 software running on my MAC, but I need
20 MEGS for Softwindows and I still get a few crashes.

I have tried Tripmate with MACaprs and it works.
I even see all 12 satellites in the display window.

Well I did it. You need to install r48 in the KPC3 to force the DTR line
high so the tripmate will turn on. Then set gpsint to ASTRAL. Connect
the two with a NULL modem cable and your set. Now if I can just find
out why the tripmate has stopped sending GGA strings.

164. GPS 25 mcx conn...

From: Paul Stump <n0lrf@computer-services.com>
Date: Fri, 06 Dec 1996 22:50:03 -0800
To: aprssig@tapr.org
Message-ID: <32A9139B.45EE@computer-services.com>
Rendered body type: text/plain

Why did I buy those $6.00 MCX connectors, when all I had
to do was VERY GENTLY pry the MCX connector off the board?
Use a small screwdriver very slowly & DON'T pull up the
circuit traces. A magnifier lamp is good for those of us
in the bifocal age.

I then stripped & soldered abt four inches of RG 316 to the
exposed pads. Crimped a female BNC, bulkhead, connector to
the other end. Drill & mount the BNC in the mini-box & you're
rolling.

Works great! Should work on the GPS 20 board as well...

Well....we will get it right sooner or later...., it is either:

http://circuit6.co.pinellas.fl.us/sheriff/index.htm

or

http://www.co.pinellas.fl.us/sheriff/index.htm pls note its note ".html" which always confuses me anyway

Bob I'll check that screw, thenks. When I turn on 232 the STA light lights and NOW ocassionally the baudot light, when I hit enter to make TNC talk to computer the goes to the CON instead of PCK as it used to. (using PKRATT) Ocassionaly now BAUDOT never come on and light goes to CON instead of PKT and program aborts.

Has anyone successfully interfaced the Tripmate with a MIM Module? This could make a nice small tracking package.

I sure don't recommend removing the MCX connector from a PCB! Remember that those are multi-layer circuit boards and they are easy to damage. It takes less than 5 minutes to put an MCX connector on a piece of cable even without fancy tools.

The screw is not your problem then. I would try resetting the tnc and reseating any socketed chips. It sounds like it still alive but confused.

Rendered body type: text/plain

```
Well, I went out and got one at Computer City for $149.95, minus a 20
coupon I had from them. DeLorme wouldn't accept my Mac registration
```

number for the direct upgrade.

I had to wire up a cable to the Mac, used the trick of connecting pins 2&3, and worked perfectly.

Cold time to first fix 2 min 10 sec. Sitting on the windowsill. Wow!

This must indeed be a 12 chan parallel receiver with that kind of lock up time. It is also very fast to track turns in the car, none of the lag you see in the single channel multiplexed units like the GPS 20/45/etc.

The unit does not have a clock that runs when the unit is powered down, so each power-up is a cold start...good thing it locks up fast. It does seem to store the last posit and the almanac...most of the startup time seem to be the search for the first sat to get the date/time, then it locks up fast.

The unit also reaquires the signal in a few seconds, again typical of multi channel units, important in a urban setting where signals get blocked by buildings.

Opening it up, the patch antenna is soldered to the top of the metal shielding, it will be tough to attach an external antenna. Lots of room to build in the power supply though. Anybody with a variable voltage power supply tried to see how low the power can go? It'd be nice to run off a simple 5v regulator, but it isn't much tougher to use a variable regulator to get 6v.

In summary, a great GPS for peanuts.

I sure wish I hadn't bought two of the GPS-20's. I'll keep one for the TAC, but if anyone wants to buy one (tested once, otherwise unused with virgin cables) I'll give you a great deal! Maybe for the next purchase TAPR could look into getting some of these Rockwell units. Strip off the software, serial cable, plastic case and antenna and DeLorme can't be paying more than $50 for these units. We couldn't buy as many, but still should be a lot less than the GPS-20.

I ordered one a few days ago, haven't received it yet, but I appreciate the good reports!

The big question:
Has anyone taken the Tripmate in an aircraft yet, and does it have an upper speed limit like the Garmin 45? Any comments on the accuracy of the altitude reading?

I'm planning to demonstrate mobile APRS to a friend who is a pilot --
hope the Tripmate will work in place of my Garmin...

Message-ID: <Pine.GSO.3.95.961207175118.27710A-100000@arctic>
Rendered body type: text/plain

WHile recently going through and re-saving all of my standard distro maps in Compressed format, I noted that some do not meet my current standards for the resons shown. While eventually, I may get around to fixing these, if there is anyone else with the 2,000,000 USGS data that wanted to fix these, then feel free to do so!

Emaps:	NYAlbany	tall format, not wide enough
	NYcentral	sparse
	ONQuebec	very sparse
SEmaps:	ALBrmham	tall format, not wide enough
	LAcentral	tall format, not wide enough
Cmaps:	NDNE	needs labels
	MTwest	needs labels
	NEOmaha	tall format, not wide enough
Wmaps:	NVVegas	tall format, not wide enough

If any of these maps are the only thing that covers your area, lemme know and I can then prioritize my time as to where to start, if no one else does it...

It <<SHOULD>> work great. The KPC-3 will interface to most NMEA standard GPS units unbuffered. My KPC-3 works fine (with a Magellan Trailblazer XL) just by attaching the NMEA data out (NMEA +) to pin 2 and the NMEA Ground to pin 7 of the KPC-3's serial connector. Of course the Tripmate requires a data input also, this goes to pin 3 on the serial connector. The KPC-3 can then send the proper initiation string to the Tripmate.

WARNING: The KPC-3 provides RS-232 voltage levels. I don't know if the Tripmate GPS can handle that voltage.

Has anyone out there tried it? I assume the Tripmate is robust enough to handle it.

I took a test drive with the Tripmate this weekend.  Excellent unit!!
Sitting on  the dash of my truck I had a lock on 5 or more sats for 80%
of the time and only lost lock for a couple of minutes during a four
hour drive.

Altitude readings were +- 400 ft most of the time and I am at sea
level.  This is the same altitude errors that my Garmin 45 gave me.

Overall a great unit. I will most likely be buying a couple of more.

GPSs output serial data.  Why are you connecting Serial NMEA GPS data to
the audio inputs/outputs of the TNC? Should go to the RS232 port instead.

<SNIP>

>mycall        callsign-9
>btext         "AnyHAM's Mobile Tracker"
>location      every 1
>beacon every  60
>unproto       aprs via wide,wide

I think that LOC may only be a Pico command.  You are telling the Pico to
begin to transmit your position EVERY 10 SECONDS (or is it 6 seconds- I
forgot) if it doesn't get a position request via HSP from an attached APRS
program.  If you are standalone, you'll be transmitting so often that no
one else will get a packet in edgewise.
```

```
And beaconing a tracker every 10 seconds in any network is sure not gonna
make you very popular!

A path of RELAY,WIDE may work better for your tracker, especailly if your
DIGI is a WIDE-RELAY.  That way, a home station can still digi you too.
Many times, the WIDE will not hear you, but a home station may.

My apologies to all but anyone watching for SANTA to fly aboard N53SD
ASTAR helicopter was sadly dissapointed.  The flight was cancelled due
to an incoming weather front causing a ceiling at or below 1000 feet.

Additionally, due to a minor mechanical function, the ASTAR helicopter
N53SD was replaced by the Bell Jet Ranger N1SD...with no prior planning
on tracker installation so we never got any signals from the tracking
unit.

Maybe next year.....

Rendered body type: text/plain

```
Reserve on your Calendar, February 15 & 16, 1997, for the finest hamfest
in the Southeast:  1997 Orlando HamCation and Computer Show

It has been many months in planning, and I actually feel we have outdone
ourselves.  Our planned Forums will be the best ever, as were fortunate to
have so many excellent volunteers, a star-studded line-up to help make it
possible.  To begin with, our APRS short forums will be from the experts.
Bob Bruninga, WB4APR, will be traveling here from Glen Burnie, Maryland to
present DosAPRS.  Keith Sproul, WU2Z, and Mark Sproul, KB2ICI, will be
joining with us to present MacAPRS and WinAPRS.  Steve Demise, K4HG, has
also promised to come and give us a talk on the Internet version, JavaAPRS.
There will be an APRS Demo Booth in the Commercial area, where attendees
can meet with the experts and obtain instant registrations.  Clustered in
the same area will be the Peet Bros Co. booth displaying home Weather
Stations, Joe Agrelo in person to answer questions about his DFjr and other
new products, along with Dr. Will Clement, manufacturer of MIM Modules.
This is only the beginning.  We have invited a famous NASA Female Astronaut
to speak on Saturday.  Our DX at its best will be the Kermadecs DX Adventure
ZL8RU by Al Hernadez, WA3YVN, a dangerous Polynesian voyage to the South
Pacific to a remote volcanic island.  Emmett Henry, will give a down to
earth type presentation on the Internet and the World Wide Web.  Dust off
that scanner in your closet. Bob Grove, publisher of Satellite Times and
Monitoring Times will be giving a talk or two on Shortwave Listening. If
time permits, he will tell you Who is Where in the Spectrum.  Dr. Leslie
Kramer, WA3SGZ, "Professor", of newly-formed LMARS Ham Radio University
will be leading a Homebrew Ham Radio VHF SWR Meter construction on Sunday
and participants will get to take one home.  We have an Antenna Workshop
forum demonstration of adding elements to Quad and Yagi Antennas - How
many is enough? We will add them till we see diminishing returns. Weather
Fax Image Downloads over the radio using homemade Loop Yagi and Quadrifillar
Antennas will be demonstrated by Jesse Johnson, KB4IVO.  Grounding for
Lightning, How to Do it Right, will be presented by the wireman, Press Jones.
```

At the Radio Evaluation Booth, a Tektronix Communication Test Set, tracable
to the National Bureau of Standards, will scope your radio for output into
a precision load, measure frequency, depth of modulation, receiver sensitivity
and signal to noise ratio in one minute. We will not tune it or fix it, but
will tell you enough about your radio that you will know if it is still at
original company specs. If that is not enough, our Ladies Programs in
the Social Hall will have an interesting set of forums on Saturday morning
and afternoon to keep your Spouse occupied.

Taking place on February 14, 15, and 16, 1997, at the Central Florida
Fairgrounds, 4603 West Colonial Drive, Orlando, Florida, it will begin
on Friday from 5pm to 9pm in the swap table area and end on Sunday at 4pm.

We have planned 150+ Commercial Exhibits, over 500 swap tables, and the
largest tailgate area in Florida. There will be hourly prizes given, and
testing on Saturday and Sunday, and QSL Card Verification. RV Overnight
parking with Electric & Water is available.

A Fox Hunt is planned, with a very nice prize for the winner. Contact
me for further details.

We just began mailing out our flyers on this event. If you do not get
one in a week, send me an email message, or check out our Homepage:

http://www.cycat.com/users/oarc/hamcat.htm

I hope to see you there!

ARRRG...That's Dimse, not Demise...In residency they called me Dr.
Demise...but that's another story...

Also, it's javAPRS instead of JavaAPRS...a guy gets pretty touchy about
the name of his baby...and Bob prefers APRSdos.

No matter what you call it, I'm sure looking forward to this!

I am actually working on a printed manual for APRS. This manual is actually
120 pages with table of content, schematics, drawings and an index for any
subject you need to find. The manual was made using the readme files
supplied by Bob, WB4APR and should be available by the end of December.
Will have copies at HAMCATION 97, the Orlando hamfest. The cost will be
around $15.00 plus shipping and handling. If you are interested send E-Mail
to sender directly.
Jacques Voisin, KD4TWB

>
> ARRRG...That's Dimse, not Demise...In residency they called me Dr. Demise...but that's another story...

I didn't hear that story yet; now we all know. -) Don't worry, you were the only person to notice it and write about it. Now we all know. hi hi

Nobody, but us, noticed the big misspelling of Bob's name in the ad that appeared in the AES Catalog a month ago.

> Also, it's javAPRS instead of JavaAPRS...a guy gets pretty touchy about the name of his baby...and Bob prefers APRSdos.

Blame it on the Sproul Brothers. They have chosen a pattern of naming their program in a most understandable way, I simply followed suit and was caught up in the trap at 1am in the morning when everything was quiet in our household. I should have known better to not to write this after spending Saturday with our club applying labels to 36,000 flyers.

> No matter what you call it, I'm sure looking forward to this!
>
> Steve K4HG

I am glad to hear this. For us the work is just beginning, and we have more flyers to distribute.

Notice how it says to e-mail DIRECTLY ? That doesn't mean directly to
the SIG, it means DIRECTLY to the originator of the msg, so the rest of
us do not have to wade through mountains of mail meant for one person.

Hopefully the balance of the responders will not make the same error.

> ddoulou@amsat.org
>

The reason that you lost the GGA strings is that by just using ASTRAL
as the init string, the GPS only sends the $GPRMC and $PRWIZCH strings.

I built an interface box this weekend that:

1) uses a 5 volt regulator to feed pin 9 (ran all weekend on just under 5
volts)
2) Switches 5 volts to pin 4 (this turns on the GPS)
3) Switches pins 2 & 3 together so GPS inits itself (this produces the
above
    mentioned two string output).

I was going to install the regulator in the GPS but decided to keep the
extra
heat out of it. I also installed two blocking diodes from the batteries and
the
5 volt supply so that the batteries will keep the unit powered up while I
move
it from one vehicle to another and then the 5 volt regulator takes over. I
haven't hooked it to the KPC3 yet.

TAPR has room for a few additional beta-testers in the MIC-E beta test.

Submit an application using the MIC-E Beta Application, which can be found on:

http://www.tapr.org/tapr/html/mic-e.html

TAPR is only taking applications until Wed Dec 11th (5pm).

Anyone wanting to participate in these beta slots will have to pay with the
TAPR office by Visa/Mc ***once notified of being accepted*** by Friday (Dec
13th).

Do not call the TAPR office about the Beta spots until notified.

We will send out messages to everyone who submits an application by Thursday.

My PK-232MBX hangs up os often that I installed a small switch on the
front, in series with the backup battery.  It allows reset if all else
fails, with out taking the cover off (with the main power off, of course).
When you turn it back on, you will need to type several *s th set the
auto-baud with the computer.

Greg....

Just a note about the status of things here in Kansas City.  As you are
already aware, Bill Young, KB0UZQ, is dropping out of amateur radio for a
time and will not be participating in the beta test team here.  He is also
the treasurer (having resigned) of the KCAWG and we are in the middle of
trying to get the money out of Bill's account and into ours at this time.

Nothing funny going on, so please don't read anything into this message!

Our Board of Directors has asked Bill to draw a money order for payment of
the two remaining units which we are designated to receive ($190.00).  That
payment is supposed to be mailed to Dorothy Monday morning.  I will advise
you of the status of the payment tomorrow by EMail.

My NDA went out in the mail earlier this week and should be in the TAPR
office in the next couple of days barring an avalanche of Christmas cards
and packages inundating Phoenix! <snicker>

I have not had any success with accessing the FTP site for MIC-E
information. Would you send along the instruction for access once again?

Thanks and

199. Ol'e reliable trackers

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 8 Dec 1996 23:21:32 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.961208230914.20927A-100000@arctic>
Rendered body type: text/plain

```
DUring the Army/Navy footbal run this year, the mids wanted to have HF,
MARS, and UHF SATCOM in addition to APRS for the chase vehicle.  What they
overlooked is the amount of effort involved, hi hi....  I built an
aluminum plate which matched the mounting holes of the glove box lid
hinges and mounted ALL of the non-APRS radios to that.  Just four screws
and everything was installed with a single cable going to clip leads on
the battery.  Total installation time about 30 minutes with antennas....

The purpose of this note is to brag a little about my APRS bread pans.
These are just upside down baking pans with the GPS, TNC, and radio all
inside.  We just duct tape them to the roof, tape a cable down the
windshield to the battery and your on the air (as a stand-alone) or flip a
switch and run a second cable through a window to a laptop and you have
full APRS...  The cable from the tracker to the computer also includes 12
volt power for the laptop, so there are no cigarette lighter cords.

Its not pretty, but its quick..  Just thought you'd be interested... hi hi

P.S these are the same ole' ones we used in 93.  If I had to do it over, I
would put 10-25 watt mobile rigs inside instead of 1 watt HT's...  But I
tstill think this is the best design for rapid reaction installations.
Probably not the best for your psersonal tracker, but a good idea for club
and special event trackers...
